PHILIPS RADIOPLAYER MODEL 216

SPECIFICATIONS

(Subject to alteration without notice)

Power Supply		 •		200/250V, 40-50 c/s
Tuning Range		 		530-1620 Kc/s
Intermediate Frequency		 •••••	•••••	455 Kc/s
Cabinet	•••••	 ******		Radiogram
Record Changer (Stereo)		 ,		Philips type AG1014SX or NG1020
Pick-up Head (Stereo—78 r.p	o.m.)	 		Philips type AG3066
Pick-up Head (Stereo-Micro	ogroove)			Philips, type AG3063

IMPORTANT! When ordering spare parts, quote CODE NUMBER of part and MODEL NUMBER of Receiver. In claiming free replacement under GUARANTEE, return defective part PROMPTLY and quote MODEL and SERIAL NUMBER of Receiver and DATE OF PURCHASE.

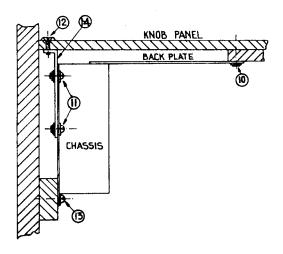

216

TO REMOVE CHASSIS FROM CABINET.

Remove receiver power plug, back panel and the five push fitted functional control knobs. Withdraw the loudspeaker and pick-up plugs from rear of receiver chassis together with the two mains lead plug connections. Remove 2 pin polarized plug (braided lead) from 2nd Amplifier chassis and release from P.V.C. sleeving attached to side of cabinet. Unscrew the aerial and earth terminal strip and disconnect the internal aerial.

To withdraw chassis initially remove the two \$\frac{5}{2}"\$ Whit, brass countersunk screw (12) threaded into each mounting bracket (14) through receiver knob panel adjacent to the tuning and volume control knobs. Removal of the two wood screws and washers (10) supporting dial back plate and the two metal thread screws and washers (13) securing chassis rear flange will now enable the chassis complete with dial scale, etc., to be withdrawn. This latter procedure can be simplified and the requirement for chassis support largely eliminated if receiver is first placed face downwards on a suitable protective surface. Note that separation of mounting brackets (14) from chassis end flanges is not required for chassis withdrawal.

The replacement of the chassis is a reversal of the above procedure.

MAINS VOLTAGE ADJUSTMENT.

The power transformers are provided with two mains voltage tappings on the primary winding—200/230 volts and 240/250 volts—for adjustment to the supply voltage at the point of installation. The receiver is adjusted at the factory to the 240/250 volts tapping.

DIAL CALIBRATION.

Ensure that the line of pointer is square relative to scale. The pointer should lie inside the two parallel marks approximately adjacent station 7ZL on the R.H. scale border when set midway between similar markings on the opposite side.

An equal calibration error over entire dial scale range can be corrected by simply sliding the cursor on drive cord in the appropriate direction. Calibration is correct when a gang closed setting (tuning knob fully clockwise) corresponds with a pointer position over the stop mark on L.H. border line.

ALIGNMENT.

Check dial calibration and if necessary adjust cursor position as described in the foregoing.

For I.F.T. and R.F. trimmer locations refer to circuit diagram inset drawing.

Set volume control to maximum, tone and balance control to a central position.

I.F. ALIGNMENT.

Screw out iron core at 2nd I.F.T. primary.

Apply modulated 455 Kc/s signal via a 100 pF capacitor to control grid (pin 2) of V1 and peak I.F.T. cores in the following sequence: —

Secondary 2nd I.F.T.

Secondary 1st I.F.T.

Primary 1st 1.F.T.

Primary 2nd I.F.T.

Do not repeat any adjustments.

R.F. ALIGNMENT.

Use a Standard R.M.A. dummy aerial and apply a modulated R.F. signal to aerial terminal.

Alignment frequencies are: 1,420 Kc/s, 3XY (peak oscillator (C8) and aerial (C2) trimmers), and 600 Kc/s, 7ZL (peak L3, 4 oscillator slug while rocking gang).

Do not attempt to adjust the iron core of the aerial coil.

SPEAKER PHASING.

When speaker replacement is necessary, it is essential to determine correct phasing before connecting new speakers into circuit. Reference to the circuit diagram will show that one voice coil terminal of each speaker is marked with \oplus sign, which is designated as the positive side.

To determine the positive terminal, connect a battery across the voice coil; the positive terminal will be connected to the positive side of the battery when the cone movement is out or forward. Speakers must be connected as in the circuit diagram.
