A quick check for a short or leakage in the RF section can be made by measuring the resistance to chassis.

If OC26 or AD140 is changed, it is most important to reset collector currents for both 6 and 12 volt operation to values shown on circuit. Always set Rl (l2 volt) first.

A quick check for a short or leakage in the RF section can be made by measuring the resistance to chassis.

If OC26 is changed it is most important to reset collector currents for both 6 and 12 volt operation to values shown on circuit. Always set R1 (12 Vol.t) first.

## Note:

420 Pf condensers across IF's, although sometimes branded 390 Pf are actually close tolerance 420 Pf .

## Modification

.0047 mfd condensers have been substituted for .0068 shown on circuit. However, as capacity is not critical, values as high as .0068 may be used without noticeable effect on performance.
