2 50 mW, maximum

**Notes :**

1. Measurements of voltages and current should be at minimum volume and at no input signal.
2. Voltages indicated in the schematic diagram are given as standard values measured by Vacuum-tube Volt Meter. When 1 K $\Omega$ /1 V Tester is used for voltage measurement, please note that you will get lower values (-0.1V on Collector, -0.2V on Base and -0.1V on Emitter respectively) than the above-mentioned standard values obtained by Vacuum-tube Volt Meter.
3. Please make your current measurement within the range of 1 mA. Collector current of each transistor TR-1 ( $I_{C1}$ ), TR-2 ( $I_{C2}$ ) and TR-3 ( $I_{C3}$ ) are to be measured at the points, as illustrated on the printed circuit board removing solder on them.
- Those of other transistors can be measured by cutting the printed circuit on the board.
4. Values of resistor  $R_8$  (15 K $\Omega$ ),  $R_2$  (27 K $\Omega$ ),  $R_{12}$  (68 K $\Omega$ ) and  $R_{22}$  (2.7 K $\Omega$ ) given in the diagram may be variable according to radio receiver.

**MAIN PARTS LOCATION & PRINTED CIRCUIT BOARD**

**ALIGNMENT PROCEDURE**

OUTPUT METER ..... Connect Output Meter across speaker voice coil.

OUTPUT LEVEL ..... Attenuate Test Oscillator output always maintain 0.4 volt on Output Meter to prevent overloading of the receiver.

TEST OSCILLATOR ..... Modulate Test Oscillator at 1000c/s and connect the lead wires of Test Oscillator output to Radiation Loop Coil.

RADIO RECEIVER ..... Place the radio receiver 20cm away from Radiation Loop Coil.  
Set volume control to maximum and tone control lever to "HIGH".

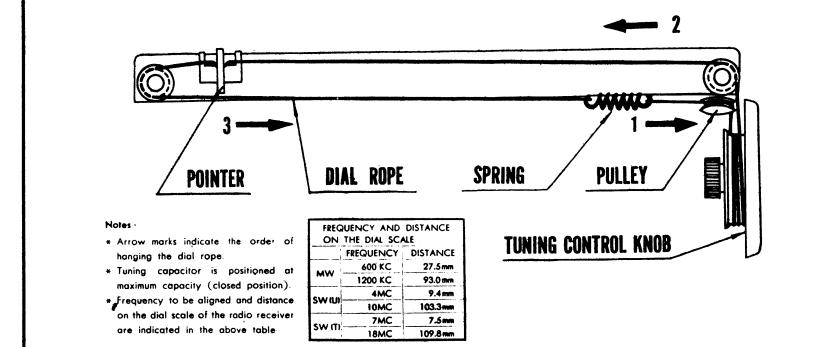

RADIATION LOOP COIL ..... Make up a 20 turn, 15 cm diameter bobbin, using 1mm copper wire.
