

"His Master's Voice" SERVICE MANUAL

for

FIVE - VALVE A.C. CLOCK - CONTROLLED MEDIUM - WAVE CHASSIS TYPE 63

THE GRAMOPHONE COMPANY LIMITED

(Incorporated in England)

HOMEBUSH - - N.S.W.

TECHNICAL SPECIFICATION

POWER SUPPLY:

200 to 250 volts, 50 c.p.s.

CONSUMPTION:

36 watts.

FREOUENCY RANGE:

540 Kc/s to 1600 Kc/s.

I.F. FREQUENCY:

457.5 Kc/s.

SPEAKER:

Permagnetic 5in. x 7in.

Voice Coil Impedance, 4 ohms at 400 c.p.s.

VALVE COMPLEMENT

6BE6 Frequency Changer

6BA6 I.F. Amplifier

6AV6 A.V.C.-Demod.-Audio Amp.

6M5 Power

6X4 Rectifier.

DIAL LAMPS:

6.3 volt, 0.3 amp.

CIRCUIT DESCRIPTION

This chassis is a five-valve A.C. clock-controlled superheterodyne receiver for medium-wave reception.

FREQUENCY CHANGER

The aerial is coupled to the frequency changer valve by means of a high-efficiency iron-dust cored aerial transformer, L1-L2.

A pentagrid converter, V1, is employed as a frequency changer. The oscillator operates on the high-frequency side of the signal frequency, and incorporates a fixed padding capacity, C4. Tracking adjustment is provided for by means of the adjustable iron-dust tuning core in coil L3.

I.F. AMPLIFIER

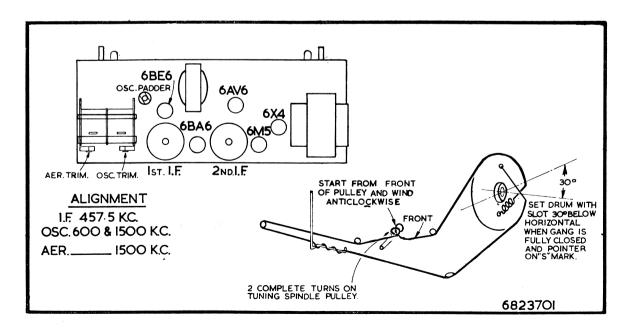

The frequency changer valve is transformercoupled to a remote cut-off pentode, V2. This valve is, in turn, transformer-coupled to the demodulator diode section of the duo-diode triode valve, V3. Both I.F. transformers have fixed tuning capacitors, and permeability tuning is provided by means of iron-dust tuning bolts.

DEMOD., A.V.C. AND A.F. AMPLIFIER

Simple A.V.C. is used to obtain A.V.C. potentials for the frequency changer and I.F. amplifier.

The demodulated signal across the diode load VR1, is applied to the grid of the triode section of V3.

The audio amplifier is resistance - capacity - coupled to the grid of the beam power output valve, V4.

AUDIO OUTPUT AMPLIFIER

The Beam Power Output valve, V4, is transformer-coupled to the loudspeaker. Inverse feedback is provided by feeding voltage from the voice coil via C22 to the cathode of the 6M5 output valve.

H.T. SUPPLY

The power supply employs an indirectly-heated-type high-vacuum valve, V5, as a full-wave rectifier. Unfiltered high tension voltage is fed to the power output valve plate circuit, whilst the remaining receiver circuits are supplied with H.T. through a resistance-capacity filter.

CONTROLS

This instrument has six controls, three being on the clock, and three on the receiver.

Clock control settings should be used as follows:

REQUIRED FUNCTION

- (1) To adjust clock time
- (2) Switch radio manually on or of
- (3) Switch radio on automatically at any predetermined time
- (4) Alarm clock function
- (5) Automatic switching off after one hour's operation
- (6) Switching off after one hour's or less operation, followed by switching on at a predetermined time.
- (7) Switching off after one hour's or less operation, to be followed by radio operation and alarm signal at a predetermined time

OPERATION

Pull out clock shaft control at rear of cabinet and turn.

Set right-hand clock switch to appropriate position.

Set right-hand clock switch to "off" position. Push in clock shaft control at rear of cabinet and adjust red alarm pointer to required switching-on time; then set right-hand clock switch to "Auto Radio" position.

Set right-hand clock switch to "off" position. Push in clock shaft control at rear of cabinet and adjust red alarm pointer to required alarm time; then set right-hand clock switch to "Radio Alarm." Note: Radio receiver will be switched on 10 minutes before alarm functions. To switch alarm off, turn right-hand control to "on" position.

Turn left-hand clock control fully clockwise and set other control to "off" position. For period of operation less than one hour, the "Sleep" control should be set at an intermediate position.

Set right-hand clock control to "off" position. Turn "Sleep" control to required setting. Push in clock shaft control at rear of cabinet and adjust red pointer to required switching-on time; then set right-hand clock switch to "Auto-Radio" position.

Set right-hand clock control to "off" position. Turn "Sleep" control to required setting. Push in clock shaft control at rear of cabinet and adjust red pointer to required alarm time; then set right-hand clock switch to "Radio Alarm" position.

The three receiver controls have their functions indicated in adjacent positions on the dial glass. These functions are:

 $\left. \begin{array}{c} \text{Volume} \\ \text{Tone} \end{array} \right\} \quad \text{Tandem Controls.}$

Tuning: Single Control.

RECEIVER ALIGNMENT PROCEDURE

In any case where a component replacement has been made in either the tuned I.F. or R.F. circuits of a receiver, all circuits must be realigned. I.F. alignment should always precede R.F. alignment, and even if only one coil has been serviced, the whole of the realignment should be done in the order given. An output meter should be connected across the voice terminals of the speaker

to indicate that the circuits are tuned to resonance In carrying out the following operations, it is important that the input to the receiver from the signal generator should be kept low and progressively reduced as the circuits are brought into line, so that the output meter reading does not exceed about 1 volt.

I.F. ALIGNMENT

- (1) Rotate the volume control fully clockwise and fully enmesh the tuning capacitor vanes. Connect the output leads of a signal generator to the grid of the 6BE6 frequency changer valve through a 0.1 mf. capacitor.
- (2) Tune signal generator to exactly 457.5 Kc/s.
- (3) Adjust the I.F. transformer tuning cores for maximum reading on the output meter, commencing with the second I.F. transformer and following with the first.
- (4) Continue this alignment on each transformer in turn until no greater output can be obtained. It is necessary to repeat this procedure twice to ensure correct alignment.

Note: If tuning cores are screwed too far in, it may be possible to obtain a false peak, due to coupling effects between the iron cores. Start alignment of each individual transformer by first screwing its core well out, and then advancing core into the coil until resonance is obtained.

R.F. ALIGNMENT

(1) With controls set as for I.F. alignment, connect signal generator output leads in series with a 200 mmF capacitor to the aerial and earth terminals of the receiver.

- (2) Check that, when the gang capacitor is fully enmeshed, the pointer coincides with the setting line on the extreme left of the dial scale. If necessary, the pointer must be adjusted at the point where the drive cord is attached to the pointer carrier.
- (3) Tune signal generator to 600 Kc/s.
- (4) Rotate tuning knob until the pointer is exactly over the 600 Kc/s calibration mark (above 7ZL), and adjust the padder screw for maximum response.
- (5) Tune signal generator to 1500 Kc/s.
- (6) Rotate tuning knob until the pointer coincides with the 1500 Kc/s calibration mark (above 5DR), and adjust the oscillator trimmer and aerial trimmer in turn for maximum response.
- (7) Repeat operations (3) to (6) inclusive for proper alignment.

Any further service information may be obtained by addressing an inquiry to the "Service Division, E.M.I. (Aust.) Pty. Limited, 575-577 Parramatta Rd., Leichhardt (telephone LM1491).

During the course of production of this receiver, the Company reserves the right, without notice, to make any modifications or improvements in design which may be necessary to meet prevailing conditions.

Information concerning changes, which is likely to be of benefit to retailers and servicemen, will be notified as far as possible by issuing a Technical Data Sheet.
