

PRECAUTIONS WHEN TESTING TRANSISTOR RECEIVERS

- A. A transistor is extremely sensitive to heat. If a soldering iron is to be used close to a transistor move the transistor or place non-conductive material between the iron and transistor.

When making soldered connections to the leads of the transistors hold the lead which is being soldered between the heat source and transistor body with pliers; excess heat will be dissipated away into the pliers.

Use a soldering iron which supplies just the requirement of heat for satisfactory soldering of connections.

- B. When checking components, cut the long pigtail of the component in preference to unsoldering from the circuit board. Components checked in this way may be returned into the circuit by pressing the ends of the pigtail together then solder. Faulty components should be removed from the circuit board by cutting through the body of the component leaving two short stubs of wire protruding (approx. 1/8") above the circuit board. The pigtail leads of the new component are to be soldered to these stubs.
- C. A continuity meter must not be applied to the receiver wiring with the transistor in circuit. A transistor must not be checked for continuity with an ohmmeter as the applied voltage and resultant excess current flow may result in permanent damage to the transistor. A voltmeter of at least 20,000 ohms/volt or a high impedance vacuum tube type voltmeter is a safe means of measuring circuit voltage.
- D. A screwdriver or similar instrument must not be used to short components together or to the common positive. The use of this method of checking for the existence of voltage or signal clicks may result in permanent damage to the transistors and components.

STORAGE WHEN OUT OF USE

It is not advisable to leave an exhausted battery in the receiver. If the receiver is stored away or not required for long periods, even partly-used batteries must be removed and stored in a dry cool place. This is a precautionary measure against the swelling and corroding action of worn-out batteries, which applies to all battery operated devices, such as torches, etc.

CLEANING OF CABINET

Do not polish the plastic or metal sections with an abrasive material, motor car polish, boot polish or similar household cleaning fluids as permanent damage may result to the finish of the cabinet. To restore the lustre of the cabinet wipe with a soft cloth dampened with water and lightly polish with a neutral wax.

SUPPORT STRAP - RECEIVER TO CAR SEAT

A strap and strip assy. is supplied, to prevent the receiver from tipping whilst in use on a car seat. Loop the strap to the handle of receiver. Fashion the rigid strip section to form a hook over the back support section of seat.

FAULT LOCATION GUIDE - GENERATOR TEST

Connect generator through a 0.1 mF capacitor to the following points :-

CAUTION: Always start with low generator output. Strong signals, may, overload the receiver, or cause the AGC to function. Set volume control at maximum.

CHECKPOINT	LOCATION Circuit Nos. at Junction Point	SIGNAL GENERATOR FREQUENCY	SIGNAL STRENGTH
OC 74 Output Base	No. 32 & Driver sec.	Audio	Weak
OC 74 Output Base	No. 31 & Driver sec.	Audio	Weak
2N406 Driver Base	Nos. 58, 59, 28	Audio	Increased level
2N406 First Audio Base	Nos. 54, 55, 25	Audio	Further increase
Det.output at vol. cont.	Nos. 20, 52	Audio	Further increase
Turn tuning capacitor fully open.			
Det. output at Diode	Pin 5, I.F.T. 3	455Kc/s	Weak
2N410 I.F.2. Base	Pin 5, I.F.T. 2	455Kc/s	Increased level
2N410 I.F.1. Base	Pin 5, I.F.T. 1	455Kc/s	Further increase
2N412 Converter Base	No. 3 and aerial sec.	455Kc/s	Further increase
Tune receiver to generator at broadcast frequency.			
2N412 Converter Base	No. 3 and aerial sec.	Sig. Freq.	Same level as at 455 Kc/s

Connect one end of a 6.8K ohm resistor to common positive. Touch the other end on and off the following points and listen for clicks.

CHECKPOINT	LOCATION Circuit Numbers at Junction Point	STRENGTH OF CLICK
------------	--	-------------------

Transistor Base

Volume control at minimum:

OC74 Output	No. 31 & Driver secondary	very weak
OC74 Output	No. 32 & Driver secondary	weak
2N406 Driver	Nos. 58, 59, 28	loud
2N406 First Audio	Nos. 54, 55, 25	loud

Volume control at maximum:

2N410 I.F.2	Pin 5, I.F.T. 2	very weak
2N410 I.F.1	Pin 5, I.F.T. 1	weak
2N412 Converter	Nos. 36, 37, 3	loud

SIDE VIEW OF DIAL DRUM.

ALIGNMENT EQUIPMENT

Signal Generator - Modulated 400 c.p.s.
Output Meter - 15 ohms impedance.
Series Capacitor - Sig. gen. for I.F.T. alignment .1 mF
Part No. 4006-005-03.

Alignment Tools

- (a) Flat metal blade each end - Part No. 4121-001-01 for I.F.T. and osc. coil iron core adjustment.
- (b) Chisel point type - Part No. 4121-005-01 for trimmer capacitor adjustment.

ALIGNMENT CONDITIONS

Open cabinet by unscrewing the single screw located on the rear, near base of cabinet.

Volume Control - maximum (fully clockwise).
Output Level - 50 milliwatts
Output Meter
Connection - across speaker voice coil.
Supply voltage - 9 volt battery.

INTERMEDIATE FREQUENCY TRANSFORMER ALIGNMENT

Oper. No.	Generator Connection	Generator Frequency	Dummy Aerial	Instructions
1.	To junction of term. 4 of rod aerial and .01 cond. circuit No. 3.	455Kc/s	.1mF cond. in series with generator	Turn tuning gang cond. to high freq. end stop, plates full open. Peak iron core of 3rd I.F. trans. for max. output.
2.	As oper. 1	455Kc/s	As oper. 1.	Peak iron core of 2nd I.F. trans. for max. output.
3.	As oper. 1	455Kc/s	As oper. 1.	Peak iron core of 1st I.F. trans. for max. output.
4.	Repeat operations 1, 2 and 3.			

DIAL POINTER SETTING

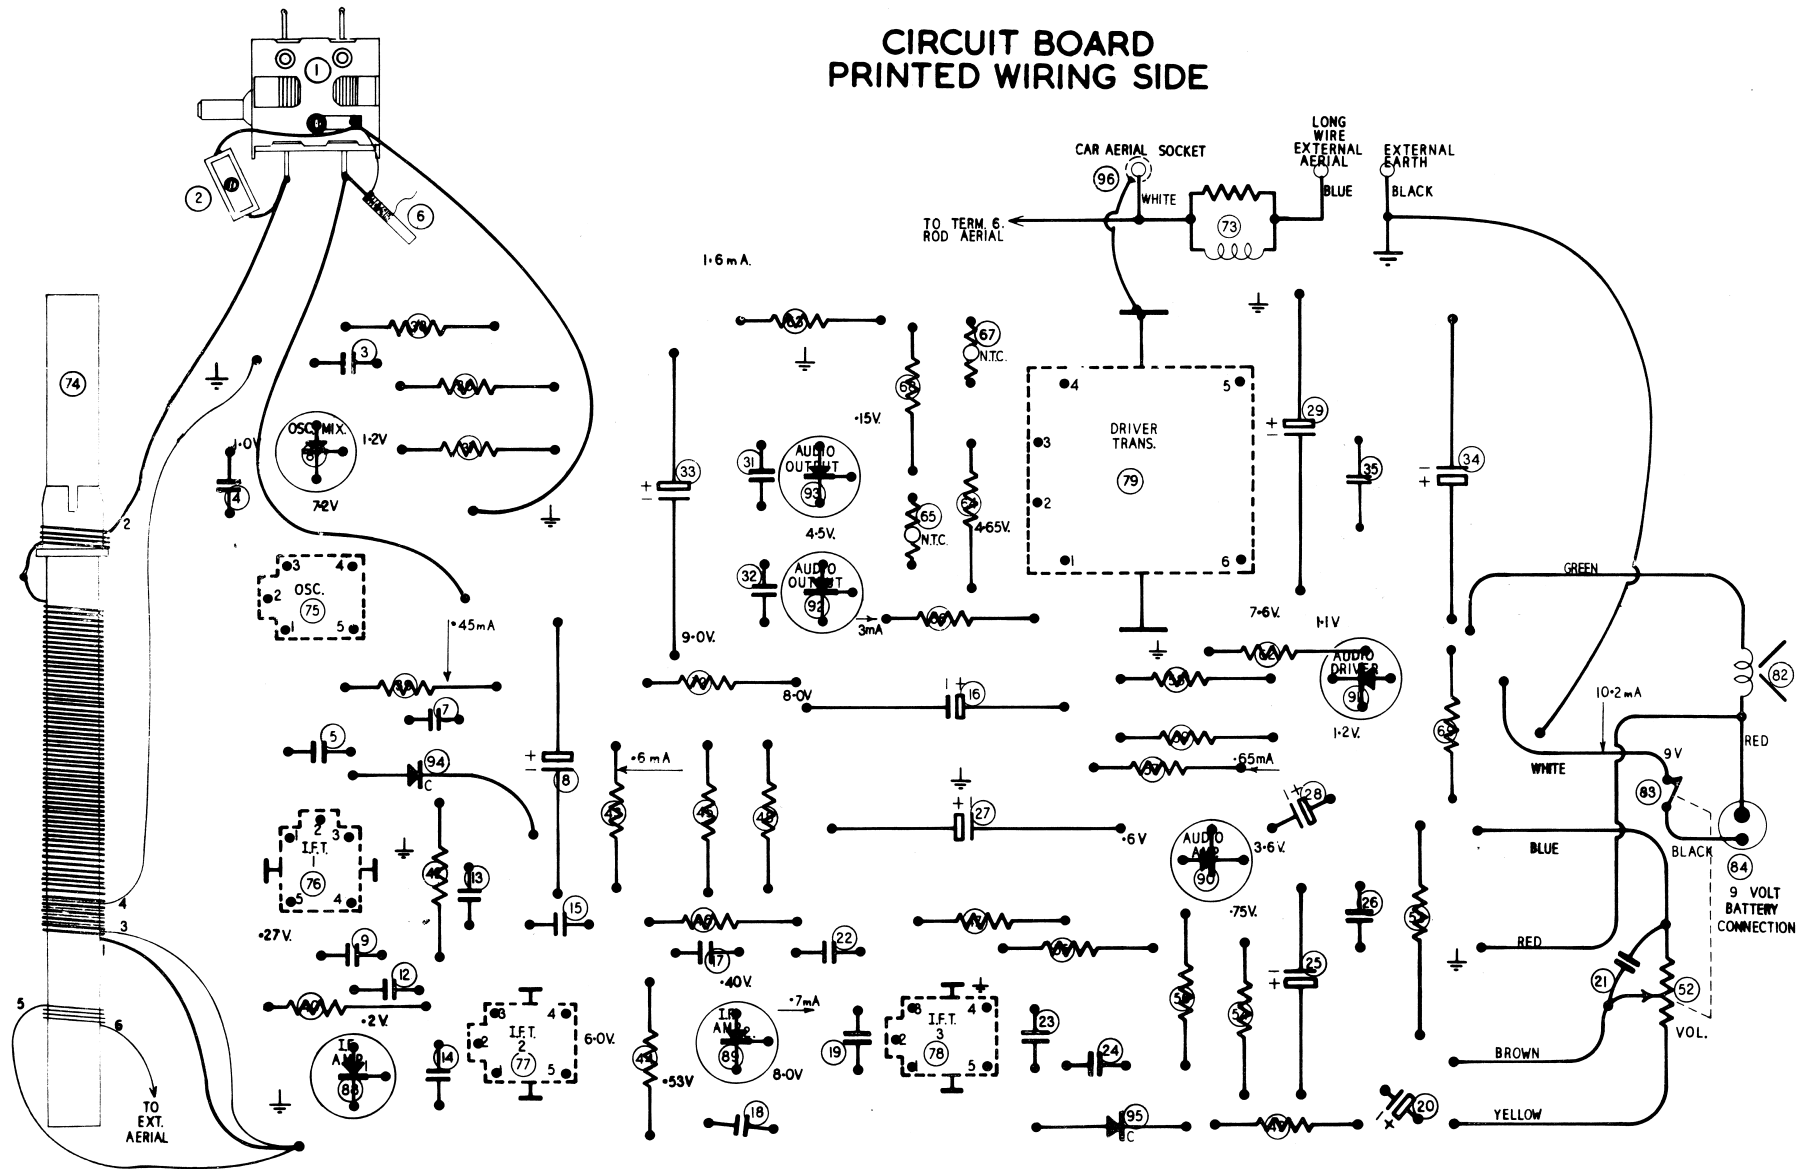

Fully mesh the gang condenser plates and align centre of indicator pointer with the centre of the low frequency end of travel spot on dial.

BROADCAST ALIGNMENT

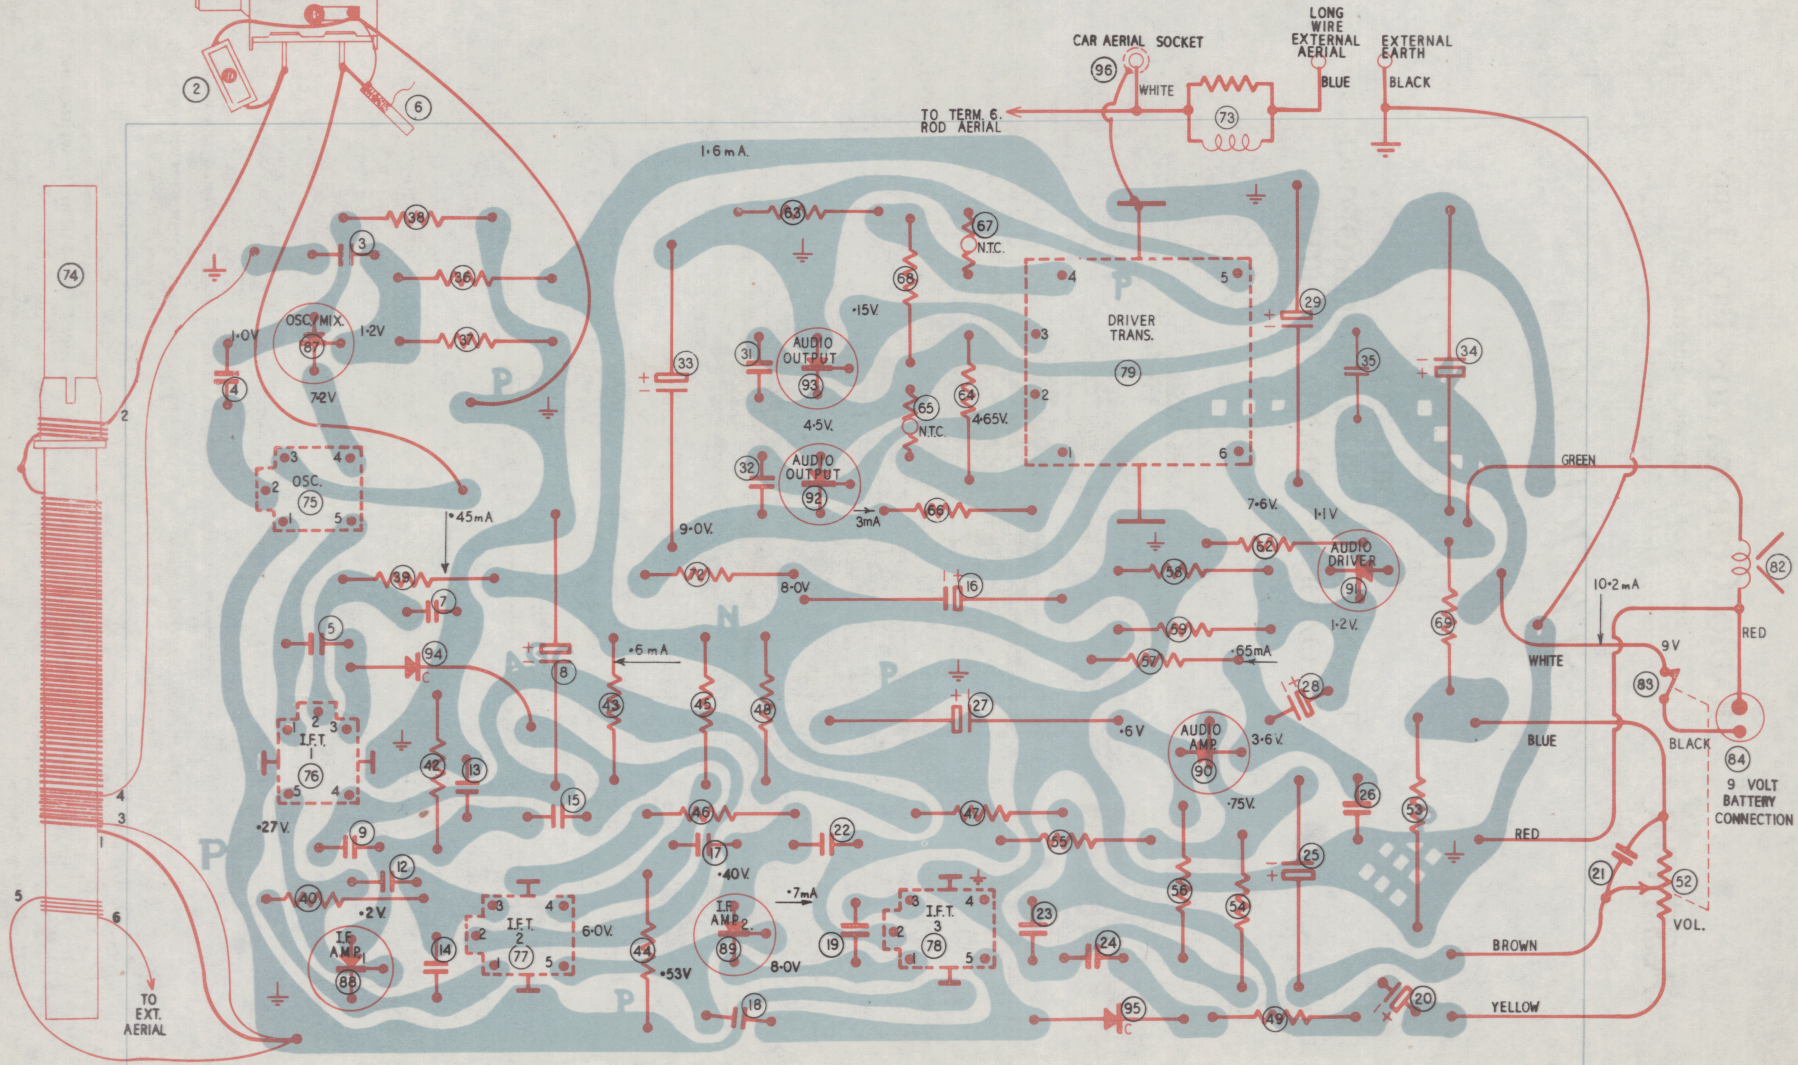

- A. To inject a signal into the receiver rod aerial, connect to the active terminal of the signal generator approximately two feet of aerial wire, then fashion the wire into a vertical position.
- B. Place receiver chassis so that ferrite rod aerial is uppermost and horizontal and so that the aerial coupling winding end of the ferrite rod points to the 2 ft. of aerial wire. A distance of not less than 1 ft. is to be between the end of the ferrite rod and the 2 ft. of vertical aerial wire attached to the signal generator.

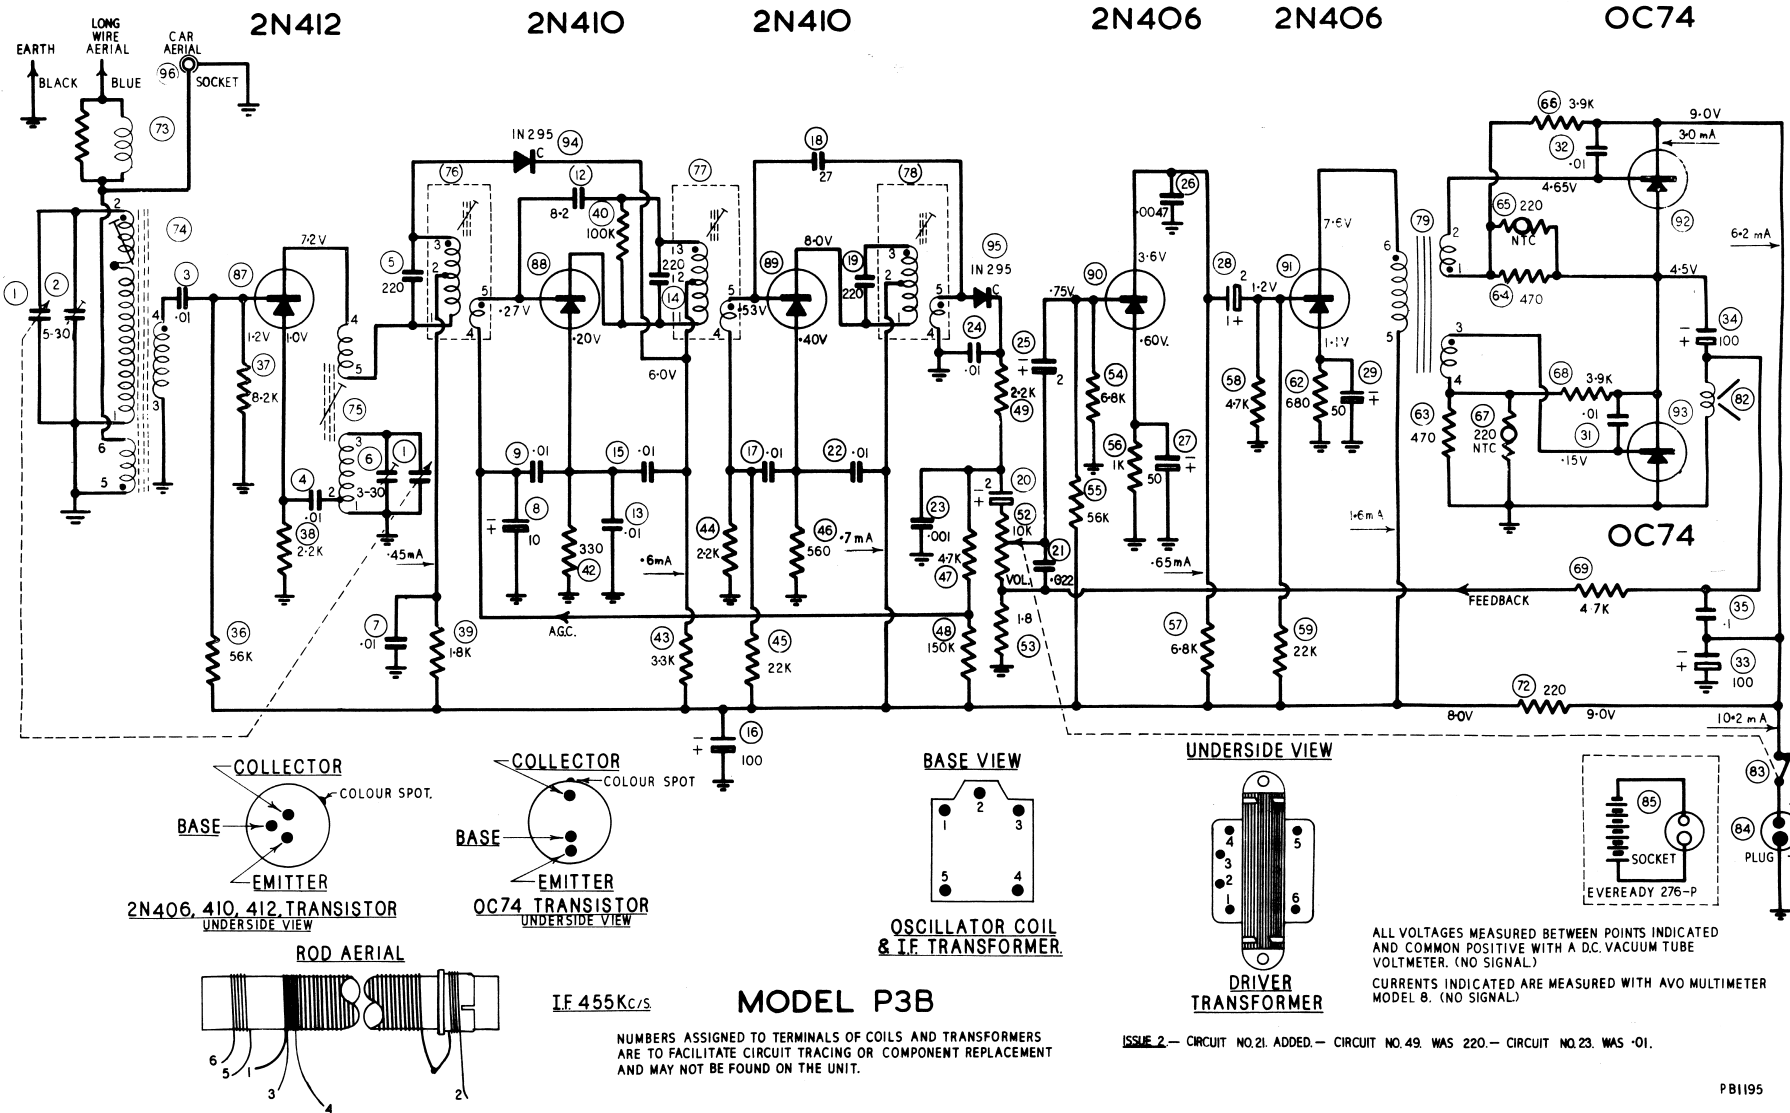

Oper. No.	Generator Connection	Generator Frequency	Instructions
1.	Refer Para. A and B.	600 Kc/s	Turn tuning gang until dial pointer aligns with 600 Kc/s spot on dial. Adjust osc. coil core and rod aerial ind. winding for max. signal.
2.	As oper. 1	1400 Kc/s	Turn tuning gang until dial pointer aligns with 1400 Kc/s spot on dial. Adjust osc. and aerial trimmer cond. for max. signal.
3.	Repeat oper. 1 and 2.		Tuning range after alignment 528-1630 Kc/s approx.

PORTABLE

7 TRANSISTOR SUPERHETERODYNE BROADCAST BAND RECEIVER

NOTE: Receiver chassis does not have to be removed from cabinet for alignment purposes.

1. ACCESS TO CHASSIS.

Open the cabinet by unscrewing the single screw located on the rear, near base of cabinet.

2. CHASSIS SERIAL NUMBER.

Located on metal chassis above speaker. Visible when cabinet rear flap is opened.

3. REMOVAL OF CHASSIS FROM CABINET.

Open cabinet, detailed in paragraph 1.

Remove knobs, pull straight off shafts.

Remove two screws from chassis, located one at each end directly below the extreme outer dial cord pulleys.

Remove the screw from base of cabinet also the external aerial and earth screws.

Disengage external aerial and earth speednuts from mount brackets then lift chassis out of cabinet.
