CLARION SERVICE MANUAL

MINI TYPE IC CASSETTE CAR STEREO

AUTO REVERSE SYSTEM

MODEL PE-809A

CLARION SHOJI. CO., LTD.

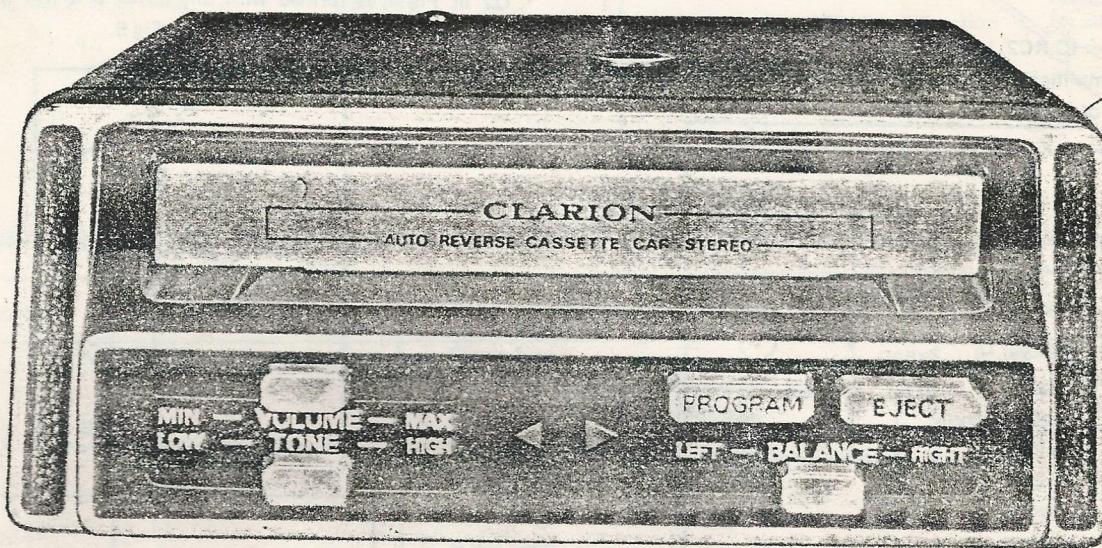

NEWKOJIMACHI BLDG., 3, 5-CHOME, KOJIMACHI, CHIYODA-KU, TOKYO, JAPAN. PHONE NO. 265-2931-4

USA BRANCH: CLARION SHOJI. CO., LTD. (U.S.A.)

2306 COTNER AVENUE, LOS ANGELES, CALIF., 90064, U.S.A. PHONE NO. 272-1178, 272-1169, 479-5556.

EUROPE BRANCH: CLARION SHOJI (EUROPA) G.m.b.H.

2000 HAMBURG 76, SCHÖNE AUSSICHT 35, GERMANY. PHONE: 2207667.

* SPECIFICATIONS:

Reproduction:	4 track, 2 channel, 2 program stereo cassette tape player (Monaural tape playable)
Tape speed:	1 1/8 ips (4.75 cm/sec)
Wow and flutter:	Less than 0.44%
S/N ratio:	More than 40dB
Cross talk:	More than 30dB (for adjacent channel) More than 40dB (for adjacent track)
Reproduction frequency range:	50Hz~10,000Hz
Automatic change time:	Less than 8 sec
Power output:	More than 3.0W x 2 (for 8% distortion) More than 3.5W x 2 (for Max volume)
Output impedance:	4 Ω x 2
Power supply voltage:	DC. 14V (10.8V~15.6V) Negative ground
Power consumption:	Less than 1.5A (at Max output) Less than 4.5A (at plunger operated)
Semiconductors:	4 Ics, 4 transistors and 2 diodes Amplifiers.....TA7063P x 2 (IC) TA7092P x 2 (IC) Auto changer.....2SC373 x 1 2SC735 x 1 2SD235 x 1 2SH21 x 1 1N60 x 1 (Diode) 1OD4 x 1(Diode)
Weight:	3.74 lbs (1.7kg)
Dimensions:	Width 5.5" (140mm) Height 2.16" (55mm) Depth 5.9" (150mm)

* COMPONENTS

PA-8092-04	Main unit	1 Set
280-3020-00	Owner's guide	1 Each
300-0490-00	Rear mounting bracket	1 Each
300-5074-00	Mounting bracket	1 Each
852-1090-02	Extension lead	1 Each
921-5701-00	Parts bag	1 Set
950-4627-00	Packaging kit	1 Set

* FEATURES

- Automatic reversing specially developed and developed and designed for exclusive use in car stereos.
- 4-track system allows the listening of two programs of stereo music from one cassette and provides monotrack playback.
- By employing 4-monolithic ICs, beautiful Hi-Fi sound is reproduced. Reliability and compact construction are utilized.
- An automatic program switching device makes it possible to automatically switch the program when the tape ends, allowing instant playback.
- The program can be switched midway through the tape by pressing the program button.
- With the incorporation as a program indicator, the program direction can be confirmed at a glance.
- A specially designed mechanism provides stable playback even while driving over tough terrain regardless of vibration resistance.

* OPERATIONAL PROCAUTIONS

- Since ICs are used in the amplifier section, care should be taken to make contact with the ground or other terminals.
- When a fuse is blown, always use the specified 5 A fuse. Other than specified fuses will damage the ICs.
- Remove the lock screws on the reverse side of the main unit prior to mounting. Also, do not insert the cassette without the removal of the lock screw.

1. ICs

- A. Pre amplifier IC (IC1 - IC51) TA7063P
- The IC in the preamplifier is equivalent to a circuit containing 3 transistors and 5 resistors as shown in Fig 1. It is very convenient when repairing to refer to a circuit equivalent to Fig. 1.
 - The transistor used in the first stage is particularly low noise and allowing amplification with high S/N and features low output impedance.
- B. Power amplifier IC (IC2, IC52) TA7092P

The power amplifier IC is equivalent to that in Fig. 2, which obtains again of 50dB.

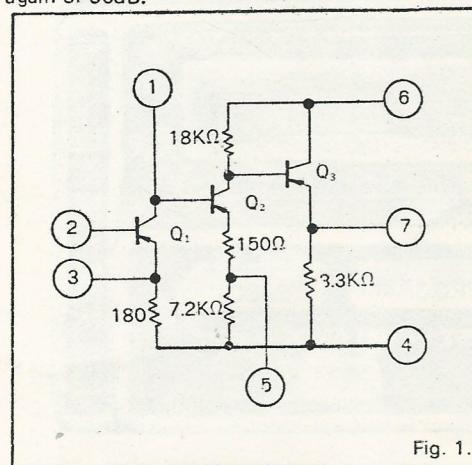

Fig. 1.

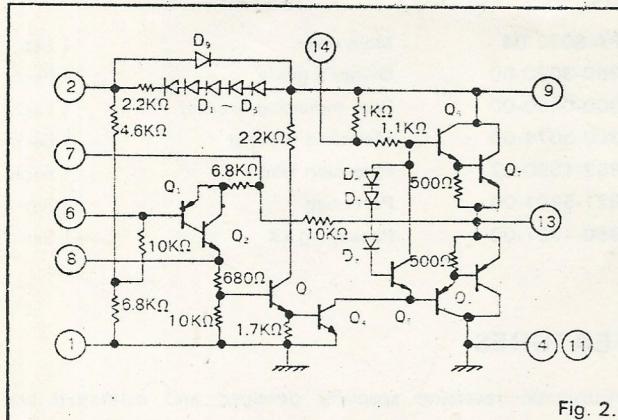

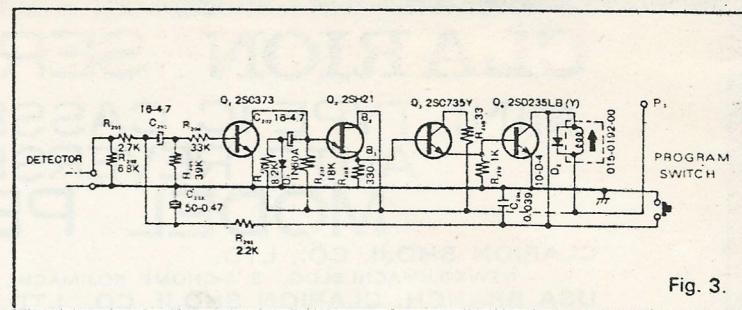

Fig. 2.

C. Precautions for ICs

- Since the clearance between the IC's terminals are very slight, do not touch a tester rod to the other terminal when measuring the terminal voltage.
- While checking ICs, an abnormal oscillation may occur inside the IC's due to induction by stray capacity. Therefore, be careful not to use exceptionally long lead wire and minimize the input capacity of the measurement devices.
- The use of a soldering iron with high capacity is not recommended, when replacing ICs.
- ICs can not withstand the voltage, current a power greater than specified. Never apply excessive voltage to the LC terminal or apply the input by short circuiting the speaker output.

(When the program is not switched within T2 seconds of the attracting time and the detector stops, the operation of T1 - T2 - T1 - T2 is repeated.) T1 is 2 ~ 8 seconds and T2 is 0.15 ~ 0.5 second.

* ADJUSTMENT OF LEFT-RIGHT AMPLIFIER

OUTPUT (Refer to Fig. 6)

When a volume difference between the left and right channel amplifiers exists or when the volume difference is noticeable at the switching time of the program adjust the semi-fixed resistor for gain control with an insulated screw driver.

Note: For adjustment, always prepare for the following

VOLUME CONTROL MAX
TONE CONTROL HIGH
BALANCE CONTROL CENTER

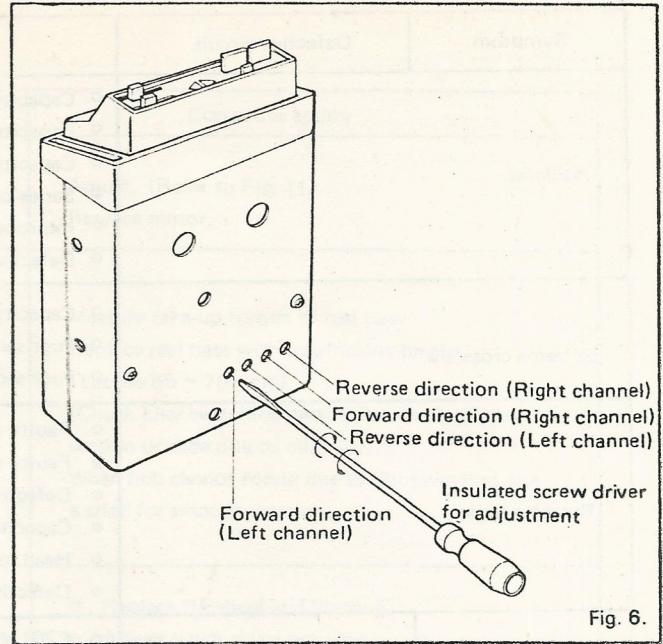

Fig. 6.

* TROUBLESHOOTING MANUAL FOR ELECTRICAL SYSTEM (Refer to circuit diagram and wiring diagram)

Symptom	Defective circuit	Defective point and cause	Corrective action
No sound	Power supply circuit	<ul style="list-style-type: none"> ○ Blown fuse ○ Poor contact of the power supply cord. ○ Filter chock (010-0820-05) open. ○ Choke coil (009-0592-00) open. ○ Defective CT-3 or poor soldering ○ Defective SW2 or defective contact ○ R102 open. ○ C102 short circuited. ○ R101 open. ○ C101 short circuited. * Troubleshooting manual for mechanical system

Symptom	Defective point and cause	Corrective action
No sound	Tape does not run. (Cause) <ul style="list-style-type: none">○ Power supply failure.○ Motor failure.	Adjust. (Refer to Fig. 11) Replace motor.
Tape is not taken up.	Malfunction of tape take-up mechanism. (Cause) <ul style="list-style-type: none">○ Defective reel base○ Malfunction of the idler○ Hub rotation failure due to warped or tight winding of cassette cartridge.	Measure take-up torque of reel base. Replace reel base with insufficient torque. (Torque 55 ~ 70 g.cm) (Check idler switching mechanism catch of idler section or slide due to oil.) When hub cannot rotate due to tight winding, use a stick for smooth rotation.
Extreme wow	<ul style="list-style-type: none">○ Seizure of capstan and bearing○ Faulty pressure in the Pinch roller○ Dirty pinch roller○ Dirty belt○ Defective take-up mechanism○ Defective motor	<ul style="list-style-type: none">○ Replace flywheel and housing.○ Adjust pinch roller pressure.○ Clean or replace.○ Clean or replace.○ Replace.○ Replace.
Automatic program switching is occurs durring playback.	<ul style="list-style-type: none">○ Faulty contact of the automatic switching detecting terminal.	<ul style="list-style-type: none">○ Ensure terminal contact to an extent that the wow becomes extreme. Lift terminal.○ Replace.

*ADJUSTMENT OF UNIT

* Rotation drive mechanism (Refer to Fig. 7)

Rotation directions of each rotation drive part is given in Fig. 7. illustrates the rotation directions for the forward playback.

For the reverse palyback, the idler and reel base rotate in the contact state.

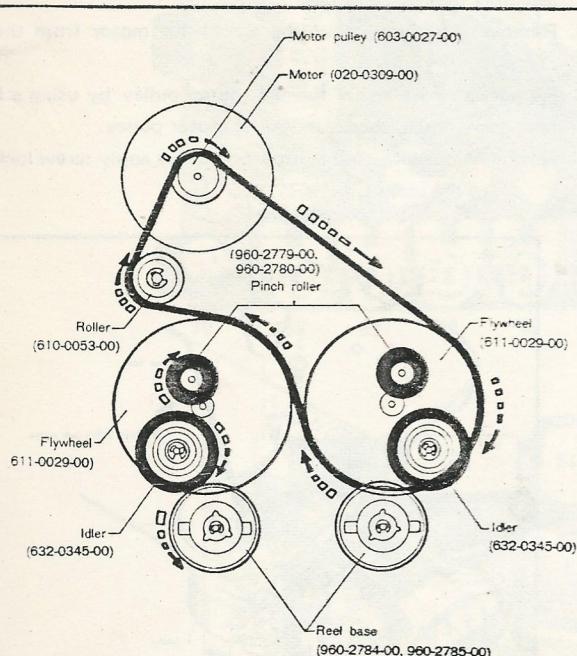

Fig. 7.

* Adjustment of the head azimuth (Refer to Fig. 8)

The azimuth can be adjusted by playing a test tape of 6.3 kHz-10VU, rotating clockwise or counterclockwise and by altering the inclination angle of the head.

At this time, switch the program and adjust to obtain the minimal azimuth difference between the forward and reverse direction. After adjustment, tighten the adjusting screw by using screw lock paint.

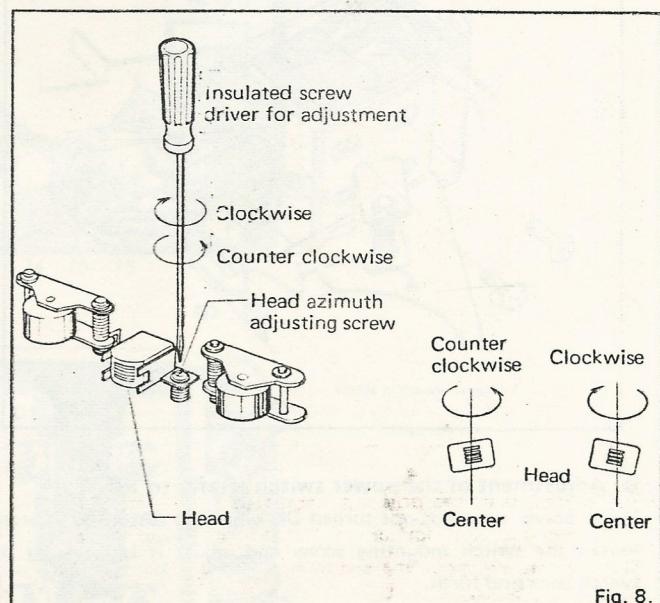

Fig. 8.

* Adjustment of pinch roller pressure (Refer to Fig. 9)

Press the center of the pinch roller mounting piece with the tension gauge in the play state and measure the pressure at the moment when the pinch roller parts from the capstan.

The normal pressure is 300g ~ 400g.

If the pressure is not within the tolerance range, replace the pinch roller pressure spring.

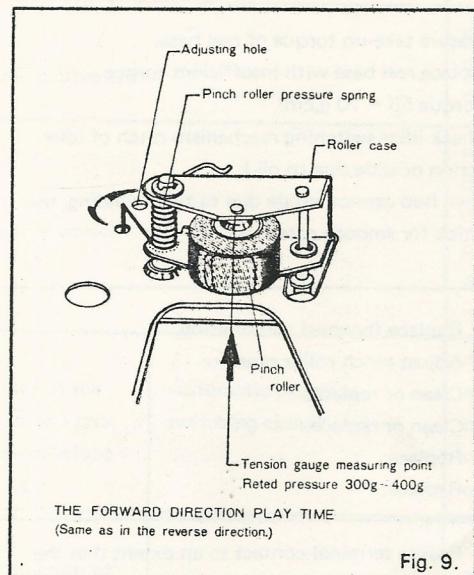

Fig. 9.

* Mounting position adjustment of plunger (Refer to Fig. 10)

When the program switching operation malfunctions due to the improper mounting position of plunger, loosen the two mounting screws move the plunger back and forth and adjust the mounting while ensuring switching operations of both forward and reverse.

Note: After adjustment, always apply screw lock paint to the screws.

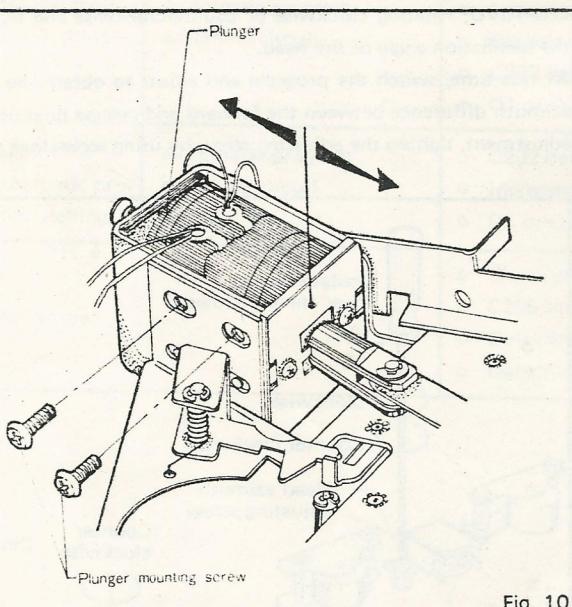

Fig. 10.

* Adjustment of the power switch (Refer to Fig. 11)

If the power supply is not turned ON when the cassette is inserted, loosen the switch mounting screw and adjust it by shifting the switch back and forth.

Note: After adjustment, always apply screw lock paint to the screws.

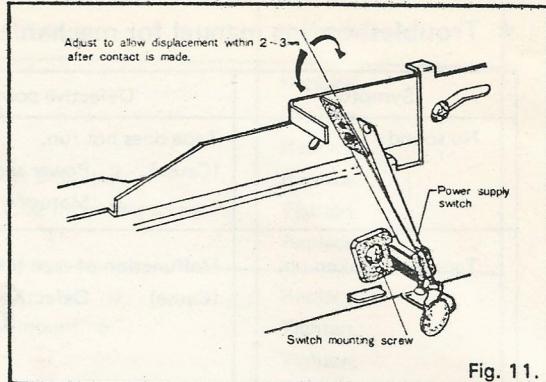

Fig. 11.

* Adjustment of the head selector switch (Refer to Fig. 12)

When it is determined that the channel sound was lost due to a defective head selector switch at the time of the directional inversion, loosen the mounting screw for the printed circuit board on which the head selector switch is mounted. Move the head selector left and right together with the printed circuit board to adjust the head selector switch operation.

Note: After adjustment, always apply screw lock paint to the screw.

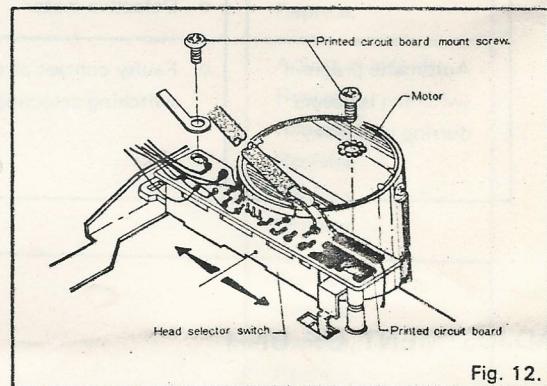

Fig. 12.

* Replacement of motor (Refer to Fig. 13)

Replace the defective motor as follows.

- Remove the filter assembly (944-0397-00)
- Disconnect the lead wire of motor power supply from the filter assembly by using a soldering iron.
- Remove the three mounting screws for motor from the plate.
- Remove the set screw for the motor pulley by using a L type hexagon wrench, then remove the motor pulley.

Note: After replacing the motor, always apply screw lock paint to the screws.

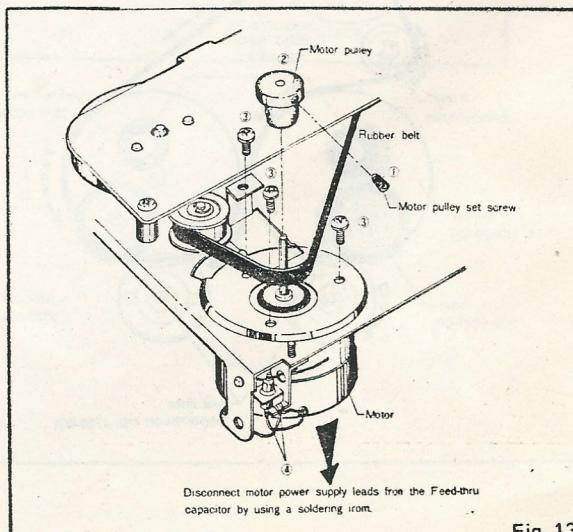

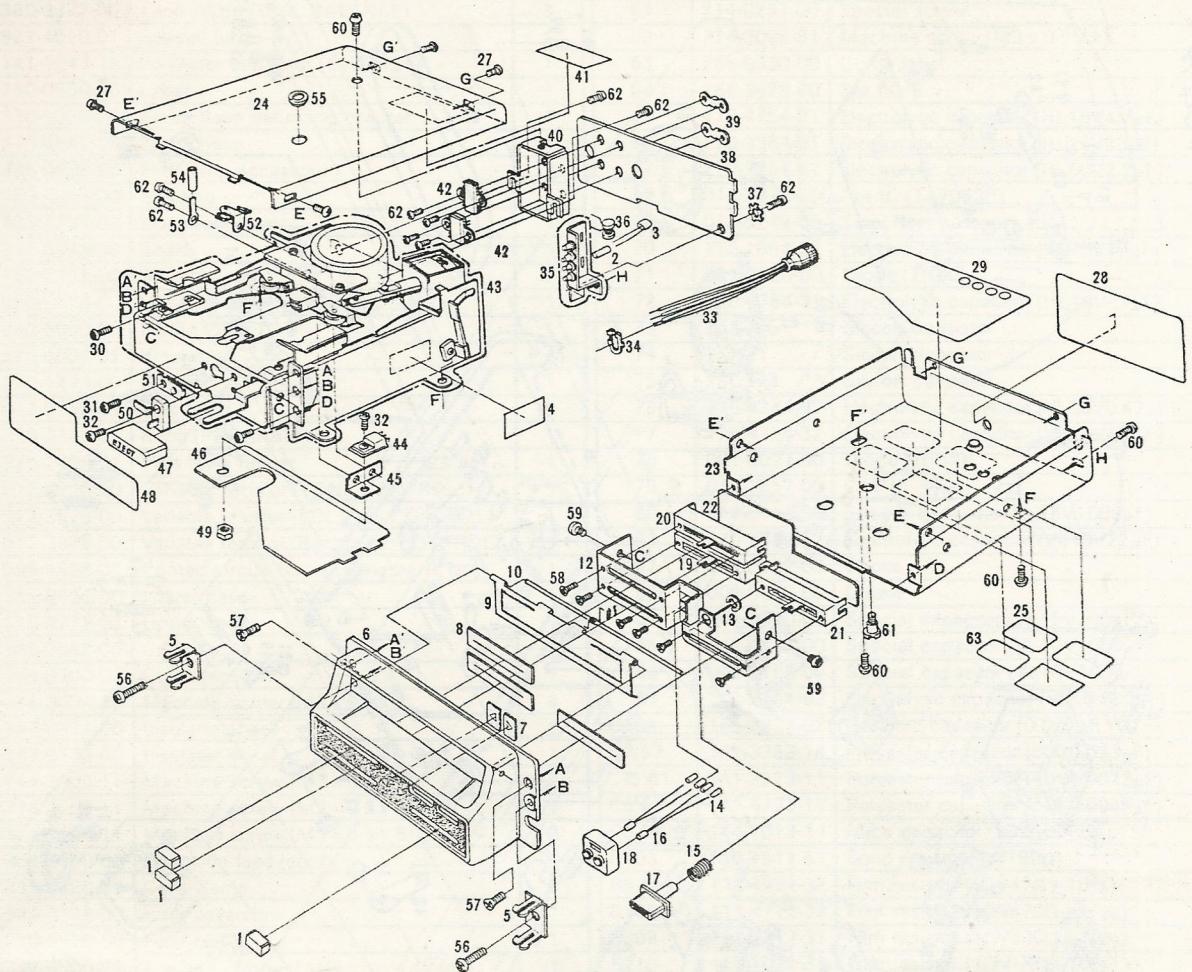

Fig. 13.

*PRINTED CIRCUIT BOARD (Refer to CIRCUIT DIAGRAM)

***CIRCUIT DIAGRAM:** Refer to the troubleshooting procedure (Voltage and current values entered.)

NOTE.1 Conduct measurements. Under no signal conditions with a tester an internal resistance of $4\text{ k}\Omega/\text{V}$ and at the following range.

V or greater 10V range.

V or greater 10V range.

ow 0.5V 0.5V range.

asurement Value may be

values in parentheses are the voltages and currents when

NOTE.2: The values in parentheses are the voltages at which program switching operation is conducted.
