ROLA TOUGH ENAMEL "D"

Rola Tough Enamel "D" is an entirely new type of Tough Enamel which in many respects is vastly superior to any of the previously available types of Tough Enamel. It combines some of the best features of Oleo-resinous and Tough Enamel coatings and, in addition, has some which are not possessed by either.

For this reason Rola Tough Enamel "D" requires a set of specifications which differ in important respects from the 10-years-old standards of vinyl-acetal enamels.

ELECTRICAL PROPERTIES

Its electrical characteristics are excellent and its dielectric strength such as to permit the use of single instead of double coated wire in many applications. This can result in a space factor improvement ranging from 3% in the heavy gauges to 12% in the fine ones.

The electrical properties of Rola Tough Enamel "D" are better than those of any Tough Enamel we have tested and are less affected by humidity than even those of Oleo-resinous covered wires. This is of great importance when it is desired to use non-impregnated coils.

MOISTURE RESISTANCE

We are now preparing specifications to cover this property of retention of electrical characteristics after immersion in water but due to the novelty of the test, these involve considerable research.

In the interim the following typical figures are provided for the guidance of Rola Tough Enamel "D" users.

.010" diameter bare wire coated with .0005" radial addition of Tough Enamel "D".

Samples 12 inches in length immersed in a mercury bath. Voltages applied between mercury and conductor.

INSULATION RESISTANCE

Test	As Made	After 1 Hour in water at 200 C.	After 30 Days in water at 200 C.
Insulation Resistance	>100,000 MΩ	>100,000 MΩ	>100,000 MΩ
Breakdown A.C. Voltage	2,000 v.	1,500 v.	1,400 v.

COLOR CODING

Another important feature of Rola Tough Enamel "D" is its inherent color-coding. It can be supplied in a range of distinctive colors, each baked into the enamel, to facilitate identification in complex coil assemblies.

SOLDERING

Another very useful feature of Rola Tough Enamel "D" is the facility with which it can be soldered without stripping. The technique used will vary with individual requirements, but it can be stated that success has been achieved with cored solder and a very hot iron.

ROLA TOUGH ENAMEL "D" WIRE PRODUCTS

Following widespread production use of Rola Tough Enamel "D" under a divergent series of commercial applications we feel the time has come to lay down Tentative

Specifications for this remarkable Tough Enamel so that prospective users may be able fully to evaluate its outstanding characteristics.

WIRE. Rola bare copper wire conforms to the specifications set out in the following pages.

DIMENSIONS & TOLERANCES. The size of each gauge of wire is expressed as its diameter in decimals of an inch. Not more than four places of decimals are used. Rola wire does not vary from the nominal diameter by more than the amounts listed in Table I.

TABLE I
DIAMETER VARIATIONS

Wire Diameter in Inches	Variation from Nominal Size
Under .0100	± .0001 inch
.0100 and above	± 1%

DENSITY. For the purpose of calculating weights, cross-sections, etc., the density of the copper is taken as 8.89 gr. per cubic centimetre (.32117 lb. per cu. in.) at 20° C. (68° F.).

RESISTIVITY. The resistivity of the copper is not more than .75% above nor 1.8% below the International Standard for the resistivity of annealed copper (.67879 micromhos per inch cube or 875.2 ohms per mile, pound) at 20° C. (68° F.).

SPOOLING. Rola Tough Enamel "D" is wound on spools under such tension as will give it an even and compact winding. A soft body of wire is considered unsatisfactory. The wire is one continuous length on each spool.

ENAMEL COATING. Rola Tough Enamel "D" is coated with a continuous insulating film of enamel of such quality as to meet the requirements of these specifications when the wire is taken directly from the spool delivered to the purchaser.

COLOUR Red is standard colour. Green, Orange, Violet and Clear are available as non-standard colours.

ENAMEL THICKNESS. The minimum and maximum permissible additions of enamel are set out in Table II.

MEASUREMENT OF ENAMEL ADDITION. The enamel addition for Rola Tough Enamel "D" conforms to the specifications set out in Table II. The addition to the diameter of the bare wire is determined by discarding a length of approximately 12 feet of wire from the spool, measuring the diameter over the enamel

TABLE II
PERMISSIBLE ENAMEL ADDITIONS

44	.0019	2	4							44

of the wire on the spool, then, by burning, removing the enamel at the point of measurement. The diameter of the bare wire is then measured and the difference between the two measurements is taken

as the addition to the diameter of the wire at this point. Three sets of measurements are made at four feet intervals and the average of these results accepted as the amount of enamel addition.

CONTINUITY OF COVERING. Wires .0020" to .0201" in diameter (bare) inclusive are tested by passing a sample of wire not less than 50 yards in length through a bath containing clean mercury. The length of wire immersed in the mercury should be 2.4 inches and the rate of travel of the wire through the bath should be 12 inches per second + 10%.

A test voltage of 50 volts is passed between the enamel and the mercury bath. A magnetic relay and counter operate for each enamel fault which passes through the mercury bath. The maximum number of faults in each piece of Rola Tough Enamel "D" wire is not greater than that shown in Table III.

TABLE III
MAXIMUM NUMBER OF FAULTS

Nominal Bare Wire Diameter (Inch)	B & S Size	Maximum Number Of Faults Per 50 Yards				
		Enamel Enamel	Double Enamel	Triple Enamel	Quadruple Enamel	
.0201-.0071	24-33	10	6	4	1	
.0063-.0031	34-40	15	9	5		
.0028-.0020	41-44	20	12			

For this test, the magnetic relay and counter are calibrated in the following manner:—The counter operates with certainty when 50 volts is maintained for 0.085 seconds across a test resistor of 10,000 ohms connected in place of the wire and mercury bath. Under the same conditions, the counter does not operate with a test resistor of 15,000 ohms. Further, the counter does not operate if 50 volts is maintained for 0.05 seconds across a test resistor of 10,000 ohms. Further, when a test resistor of 500 ohms is connected in series with the relay, the counter does operate within 0.06 seconds.

NOTE: For details of the pin-hole testing machine and method of calibration, see British Standard 156:1951.

ADHERENCE AND FLEXIBILITY. (a) When stretched to breaking point at a temperature of 15.6° — 26.7° C. (60° — 80° F.), a piece of

Rola Tough Enamel "D" having an effective length of 10 inches will not show cracks in the enamel film.

(b) *Wire sizes 29 B&S and heavier.*

A piece of Rola Tough Enamel "D" bent around itself will not show cracks or ruptures in the enamel film.

(c) *Wire sizes 30 B&S and finer.*

A piece of Rola Tough Enamel "D" stretched 25% (or to breaking point of the copper, should this be less than 25%) then wound on a mandrel three times the diameter of the bare wire, will not show cracks or ruptures in the enamel film.

These tests are to be made at temperatures between 15.6° and 26.7° C (60° — 80° F.) and with ten tightly and evenly wound turns.

ABRASION SCRAPE. In this test the surface of the wire is repeatedly scraped with an 0.016 inch diameter steel needle placed at right angles to the wire and working to and fro in a direction parallel to the wire. When wire is tested with the needle loaded with the weights specified in Table IV. the average abrasion scrape must be not less than 30 strokes and no single test less than 15. Tests are made at 0, 120 and 240 degrees around the periphery of the wire. These tests are made on two samples and averaged to determine the abrasion scrape value. Stroke frequency is 60 per minute. Wire to be tested is first wiped to remove lubricant and then stretched slightly, 1%, to remove kinks. The tests are made at a temperature of 15.6° — 26.7° C. (60° — 80° F.). Standard abrasion testers are fitted with an electrical circuit providing 12 volts at approximately 5 milliamperes between the needle and the wire sample. This circuit is designed so that it shuts off the scraper when the wire is worn through to the

TABLE IV

copper for approximately one-third of the stroke length of $\frac{1}{8}$ in.

Rola Tough Enamel "D" will meet the requirements of Table IV.

SOLVENT RESISTANCE. *Test A (i). Wires less than .0100" diameter (bare)*
 A sample of wire 10 inches in length is slowly and steadily elongated to 11 inches at the rate of approximately 12 inches per minute, then heated in air at 110° C. $\pm 2^{\circ}$ C. (230° F. $\pm 3.6^{\circ}$ F.) for 16 hours and allowed to cool to room temperature. It is then immersed for two hours in the appropriate solvent and at the temperature set out in Table V. After removal of the wire from the solvent bath the solvent on it is allowed to evaporate at a temperature not exceeding that of Table V. When the dried wire is examined under

a magnification of approximately 15 diameters no visible signs of enamel wrinkling or disintegration will be detected.

(ii) *Wires .0100 diameter (bare) and larger.*

A sample of the wire is wound on a mandrel of the appropriate size listed

TABLE V
SOLVENTS AND IMMERSION TEMPERATURES

Solvent	Temperature Range
Methylated Spirit	35- 40° C. (95-104° F.)
Xylol—Butanol (approx. 2:1)	35- 40° C. (95-104° F.)
Xylol	65- 70° C. (149-158° F.)
White Spirit	95-100° C. (203-212° F.)

TABLE VI
MANDREL DIAMETER

Nominal Bare Wire Diameter (Inch)	B & S Size	Ratio Of Mandrel Diameter To Bare Wire Diameter			
		Enamel	Double Enamel	Triple Enamel	Quadruple Enamel
.1285-.0907	8-11	4	5	6	7
.0808-.0571	12-15	3	4	5	6
.0508-.0320	16-20	2	3	4	5
.0285-.0201	21-24	1.5	2		

in Table VI, and after slipping the helix off the mandrel the sample is then heated in air at 110° C. $\pm 2^{\circ}$ C. (230° F. $\pm 3.6^{\circ}$ F.) for 16 hours and allowed to cool to room temperature. It is then immersed for two hours in the appropriate solvent and at the temperature set out in Table V. After removal of the wire from the solvent bath the solvent on it is allowed to evaporate at a temperature not exceeding that of Table V. When the dried wire is examined under a magnification of approximately 15 diameters no visible signs of enamel wrinkling or disintegration will be detected.

Test B.—After immersion without bending in any of the following liquids for 24 hours at temperatures of 15.6° — 26.7° C. (60° — 80° F.), it will be found that the insulating film on Rola Tough

Enamel "D" will not have softened sufficiently to allow it to be removed by rubbing with cheese-cloth gripped between the thumb and forefinger.

SOLVENTS:

55° Petroleum Naphtha (VMP).
Commercial Grade 3° Toluol.
1% Caustic Potash Solution.
Kerosene.
Benzene (C₆ H₆).

AGEING. After being heated (unstretched and unbent) in an oven at 125° C. (257° F.) for 168 hours, Rola Tough Enamel "D" does not show cracks when wound on a mandrel three times its bare wire diameter. Ten turns, tensioned to provide a tight, even winding, are considered adequate for this test.

TABLE VII
DIELECTRIC STRENGTH TEST VOLTAGES

Nominal Bare Wire Diameter (Inch)	B & S Size	Total Tension On Wires	Total Number Of Twists	Test Voltage			
				Single	Double	Triple	Quadruple
.1285-.0907	8-11	15 lb.	3	2300	4500	6000	7500
.0808-.0571	12-15	9 lb.	6	2000	4000	5000	7000
.0508-.0320	16-20	3 lb.	9	1700	3500	4500	5500
.0285-.0201	21-24	1 lb.	12	1400	3000	4000	5000
.0179-.0126	25-28	12 oz.	16	1000	2500	3000	4000
.0113-.0080	29-32	4 oz.	20	750	1700	2500	
.0071-.0050	33-36	1.5 oz.	24	600	1200	1700	
.0045-.0031	37-40	.5 oz.	30	450	800	1200	
.0028-.0020	41-44	.3 oz.	35	350	650		

HEAT SHOCK. Prepare samples as follows:

- (a) Wire 29 B&S and heavier—bent around a mandrel three times the diameter of the bare wire.
- (b) Wire 30 B&S and finer—stretched 20% or to the breaking point of the copper, whichever is less, and then wound on a mandrel three times the diameter of the wire.

After being placed in an oven at 125° C. (257° F.) for one hour, Rola Tough Enamel "D" samples will show no ruptures or cracks in the film.

COMPLETENESS OF CURE (Toluol-Enamel "D" immersed without Alcohol Test). out bending in a boiling mixture initially containing 30% commercial grade 3° Toluol and 70% Denatured Ethyl Alcohol by volume for a period of five minutes will, on removal, show no visible signs of swelling or blistering of the enamel except within $\frac{1}{2}$ in. of the immersed end. Four inches immersed in the liquid is sufficient for the test.

DIELECTRIC TESTS. When subjected to the following test Rola Tough Enamel "D" withstands the

TABLE VIII
ELONGATION CHARACTERISTICS
TOUGH ENAMEL COPPER WIRE

Nominal Bare Wire Diameter (Inch)	B & S Size	Minimum Elongation (Per Cent)
.1285-.1144	8- 9	30%
.1019-.0226	10-23	25%
.0201-.0063	24-34	20%
.0056-.0031	35-40	15%
.0028-.0020	41-44	10%

voltages listed in Table VII. Twist together for a distance of 4.75 inches two pieces of the wire to be tested. The tension on the wire while being twisted and the number of twists must conform to Table VII. An initial voltage of not more than 120 volts A.C. is then applied between the two twisted wires and the voltage gradually increased until the coating is punctured. The voltage should be measured with an R.M.S. voltmeter.

ELONGATION TESTS. Rola Tough Enamel "D" meets the requirements of Table VIII.

†Calculated at 1500 circular mils per ampere, (equivalent to 850 amperes per square inch).

*Non Standard.

Variations from this table within manufacturing limits maybe expected in practice.
 Resistance values are based on nominal bare wire diameters and are in accordance
 with the International Standard for annealed copper, i.e. 875.2 Ohms per
 mile/pound at 20°C. (68°F.).

GAUGE CONVERSION TABLES

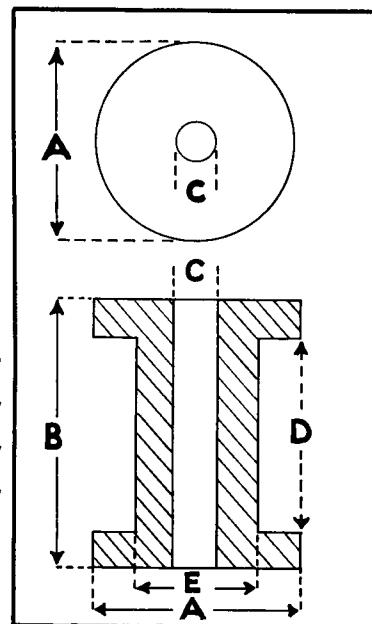

This table gives the comparative wire diameters of annealed bare copper wire drawn to American Standards (B. & S.) and of wire of corresponding gauges drawn to British Standards (S.W.G.). For added convenience it also lists the B. & S. sizes in millimeters.
