# 2205 OSCILLOSCOPE SERVICE 

## WARNING

THE FOLLOWING SERVICING INSTRUCTIONS ARE FOR USE BY QUALIFIED PERSONNEL ONLY. TO AVOID PERSONAL INJURY, DO NOT PERFORM ANY SERVICING OTHER THAN THAT CONTAINED IN OPERATING INSTRUCTIONS UNLESS YOU ARE QUALIFIED TO DO SO. REFER TO OPERATORS SAFETY SUMMARY AND SERVICE SAFETY SUMMARY PRIOR TO PERFORMING ANY SERVICE.

Please Check for CHANGE INFORMATION at the Rear of This Manual

## www.artekmedia.com

"High resolution scans of obsolete technical manuals"
If your looking for a quality scanned technical manual in PDF format please visit our WEB site at www.artekmedia.com or drop us an email at manuals@artekmedia.com and we will be happy to email you a current list of the manuals we have available.

If you don't see the manual you need on the list drop us a line anyway we may still be able to point you to other sources. If you have an existing manual you would like scanned please write for details, This can often be done very reasonably in consideration for adding your manual to our library.

Typically the scans in our manuals are done as follows;

1) Typed text pages are typically scanned in black and white at 300 dpi .
2) Photo pages are typically scanned in gray scale mode at 600 dpi
3) Schematic diagram pages are typically scanned in black and white at 600 dpi unless the original manual had colored high lighting (as is the case for some 70 's vintage Tektronix manuals).

If you purchased this manual from us (typically through our Ebay name of ArtekMedia) thank you very much. If you received this from a well-meaning "friend" for free we would appreciate your treating this much like you would "share ware". By that we mean a donation of at least $\$ 5-10$ per manual is appreciated in recognition of the time (a manual can take as much as 40 hours to reproduce, book, link etc.), energy and quality of effort that went into preserving this manual. Donations via PayPal go to: manuals@artekmedia.com or can be mailed to us the address above.

## INSTRUMENT SERIAL NUMBERS

Each instrument has a serial number on a panel insert, tag, or stamped on the chassis. The first two digits designate the country of manufacture. The last five digits of the serial number are unique to each instrument. The country of manufacture is identified as follows:

B000000 Tektronix, Inc., Beaverton, Oregon, U.S.A.
E200000 Tektronix United Kingdom, Ltd., London
G100000 Tektronix Guernsey, Ltd., Channel Islands
HKOOOOO Hong Kong
H700000 Tektronix Holland, NV, Heerenveen, The Netherlands

J300000 Sony/Tektronix, Japan

## OPERATORS SAFETY SUMMARY

The general safety information in this part of the summary is for both operating and service personnel. Specific warnings and cautions will be found throughout the manual where they apply and do not appear in this summary.

## Terms in this Manual

CAUTION statements identify conditions or practices that could result in damage to the equipment or other property.

WARNING statements identify conditions or practices that could result in personal injury or loss of life.

## Terms as Marked on Equipment

CAUTION indicates a personal injury hazard not immediately accessible as one reads the markings, or a hazard to property, including the equipment itself.

DANGER indicates a personal injury hazard immediately accessible as one reads the marking.

## Symbols in this Manual

This symbol indicates where applicable cautionary or other information is to be found. For maximum input voltage see Table 1-1.

Symbols as Marked on Equipment

Protective ground (earth) terminal.

ATTENTION-Refer to manual.

## Power Source

This product is intended to operate from a power source that does not apply more than 250 V rms between the supply conductors or between either supply conductor and ground. A protective ground connection, by way of the grounding conductor in the power cord, is essential for safe operation.

## Grounding the Product

This product is grounded through the grounding conductor of the power cord. To avoid electrical shock, plug the power cord into a properly wired receptacle before making any connections to the product input or output terminals. A protective ground connection, by way of the grounding conductor in the power cord, is essential for safe operation.

## Danger Arising From Loss of Ground

Upon loss of the protective-ground connection, all accessible conductive parts, including knobs and controls that may appear to be insulating, can render an electric shock.

## Use the Proper Power Cord

Use only the power cord and connector specified for your product.

Use only a power cord that is in good condition.
For detailed information on power cords and connectors, see Figure 2-2.

## Use the Proper Fuse

To avoid fire hazard, use only a fuse of the correct type, voltage rating and current rating as specified in the parts list for your product.

## Do Not Operate in Explosive Atmosphere

To avoid explosion, do not operate this instrument in an explosive atmosphere.

## Do Not Remove Covers or Panels

To avoid personal injury, do not remove the product covers or panels. Do not operate the product without the covers and panels properly installed.

# SERVICING SAFETY SUMMARY 

## FOR QUALIFIED SERVICE PERSONNEL ONLY

Refer also to the preceding Operators Safety Summary

## Do Not Service Alone

Do not perform internal service or adjustment of this product unless another person capable of rendering first aid and resuscitation is present.

## Use Care When Servicing With Power On

Dangerous voltages exist at several points in this product. To avoid personal injury, do not touch exposed connections or components while power is on.

Disconnect power before removing protective panels, soldering, or replacing components.

## Power Source

This product is intended to operate from a power source that does not apply more than 250 volts rms between the supply conductors or between either supply conductor and ground. A protective ground connection by way of the grounding connector in the power cord is essential for safe operation.

The 2205 Oscilloscope.

## SPECIFICATION

## INTRODUCTION

The TEKTRONIX 2205 Oscilloscope is a rugged, lightweight, dual-channel, 20 MHz instrument that features a bright, sharply defined trace on an 80 by 100 mm cathode-ray tube (crt).

Its low-noise vertical system supplies calibrated deflection factors from 5 mV to 5 V per division at full bandwidth.

Stable triggering is achieved over the full bandwidth of the vertical system. The flexibility and high sensitivity of the trigger system provides a range of conveniences such as hands-free triggering with the peak-to-peak automatic mode, independent selection of TV line and TV field triggering at any sweep speed, and single-sweep triggering. The trigger signal is dc coupled. An external triggering signal or an external $Z$-axis modulation signal can be applied via a front-panel connector and the sourceselector switches.

The horizontal system provides calibrated sweep speeds from 0.5 s to 100 ns per division. For greater measurement accuracy, a $\times 10$ magnifier circuit extends the maximum sweep speed to 10 ns per division.

## ACCESSORIES

The instrument is shipped with the following accessories:

1 Operators Manual
2 1X Signal Adapters
1 Power Cord
2 Fuses
1 Power Cord Clamp
1 Washer
1 Screw

Part numbers for these standard accessories, as well as for other optional accessories, are located in Section 7, Options and Accessories. The voltagesensing signal adapters were designed specifically to complement the performance of your 2205.

## PERFORMANCE CONDITIONS

The 2205 electrical characteristics listed in Table $1-1$ are valid when it has been adjusted at an ambient temperature between +20 C and +30 C , has had a warm-up period of at least 20 minutes, and is operating at an ambient temperature between 0 C and +40 C (unless otherwise noted).

Environmental characteristics are given in Table $1-2$. The 2205 meets the requirements of MIL-T-28800C, paragraphs 4.5.5.5.1.3, 4.5.5.1.4, and 4.5.5.1.2.2 for Type III, Class 5 equipment, except where otherwise noted.

Mechanical characteristics of the instrument are listed in Table 1-3.

Table 1-1
Electrical Characteristics

| Characteristics | Performance Requirements |
| :---: | :---: |
| VERTICAL DEFLECTION SYSTEM |  |
| Deflection Factor Range | 5 mV per division to 5 V per division in a 1-2-5 sequence of 9 steps. |
| Accuracy $+15^{\circ} \mathrm{C} \text { to }+35^{\circ} \mathrm{C}$ | $\pm 3 \%$. |
| $0^{\circ} \mathrm{C} \text { to }+15^{\circ} \mathrm{C} \text { and }$ $+35^{\circ} \mathrm{C} \text { to }+40^{\circ} \mathrm{C}$ | $\pm 5 \%$. |
| Variable Control Range | Continuously variable and uncalibrated between step settings. Increases deflection factor by at least 2.5 to 1. |
| Step Response (Rise Time) $+5^{\circ} \mathrm{C} \text { to }+35^{\circ} \mathrm{C}$ | Applicable from 5 mV per division to 5 V per division. Rise times calculated from: $\operatorname{tr}=\frac{0.35}{B W \text { in } \mathrm{MHz}}$ <br> 17.5 ns or less. ${ }^{\text {a }}$ |
| $0^{\circ} \mathrm{C}$ to $+5^{\circ} \mathrm{C}$ and $+35^{\circ} \mathrm{C} \text { to }+40^{\circ} \mathrm{C}$ | 23.3 ns or less. ${ }^{\text {a }}$ |
| $\begin{array}{r} \text { Bandwidth }(-3 \mathrm{~dB}) \\ +5^{\circ} \mathrm{C} \text { to }+35^{\circ} \mathrm{C} \end{array}$ | 20 MHz or more. |
| $0^{\circ} \mathrm{C}$ to $+5^{\circ} \mathrm{C}$ and $+35^{\circ} \mathrm{C} \text { to }+40^{\circ} \mathrm{C}$ | 15 MHz or more. ${ }^{\text {a }}$ |
| Ac Coupled Lower Cutoff Frequency | 10 Hz or less at $-3 \mathrm{~dB} .^{\text {a }}$ |
| CHOP Mode Switching Rate | $500 \mathrm{kHz} \pm 30 \%$. ${ }^{\text {a }}$ |
| Input Characteristics Resistance | $1 \mathrm{M} \Omega \pm 2 \%{ }^{\text {a }}$ |
| Capacitance | $25 \mathrm{pF} \pm 2 \% .^{\text {a }}$ |
| Maximum Safe Input Voltage (DC or AC Coupled) | 400 V (dc + peak ac) or 800 V ac p-p to 10 kHz or less. ${ }^{\text {a }}$ |
| Common-mode Rejection Ratio (CMRR) | At least 10 to 1 at 10 MHz . |
| Trace Shift With VOLTS/DIV Switch Rotation | 0.75 division or less (Variable control in CAL detent). ${ }^{\text {a }}$ |
| With VOLTS/DIV Variable Control Rotation | 1 division or less. ${ }^{\text {a }}$ |
| With Channel 2 Inverted | 1.5 division or less. ${ }^{\text {a }}$ |
| Channel Isolation | Greater than 100:1 at 20 MHz . |

${ }^{\text {a Performance requirement not checked In manual. }}$

Table 1-1 (cont)

| Characteristics |  | Perform |
| :---: | :---: | :---: |
| TRIGGER SYSTEM |  |  |
| Trigger Sensitivity |  |  |
| P-P AUTO/TV LINE and NORM Modes | 5 MHz | 30 MHz |
| Internal Signal | 0.3 div | 1.0 div |
| External Signal | 40 mV | 150 mV |
| Lowest Usable Frequency in P-P AUTO Mode | $\geq 20 \mathrm{~Hz}$. ${ }^{\text {a }}$ |  |
| TV FIELD Mode | 1.0 division of composite sync. ${ }^{\text {a }}$ |  |
| External Input | $1 \mathrm{M} \Omega \pm 10 \%{ }^{\text {a }}$ |  |
| Resistance |  |  |
| Capacitance | $25 \mathrm{pF} \pm 2.5 \mathrm{pF}{ }^{\text {a }}$ |  |
| Maximum Input Voltage | $400 \mathrm{~V}(\mathrm{dc}+$ peak ac$)$ or 800 V ac $\mathrm{p}-\mathrm{p}$ at 10 kHz or less. ${ }^{\text {a }}$ |  |
| Trigger Level Range | $\pm 15$ division referred to the appropriate vertical input. |  |

# OPERATING INFORMATION 

## PREPARATION FOR USE

This part gives you important safety information and tells you how to proceed with initial start-up of the TEKTRONIX 2205 Oscilloscope.

## SAFETY

Before connecting the 2205 Oscilloscope to a power source, read this entire section. Also refer to the Safety Summary at the front of this manual for power source, grounding, and other safety considerations pertaining to the use of the instrument. Ensure that you have the training required to safely connect inputs to the signals you will be measuring.

This instrument may be damaged if operated with the LINE VOLTAGE SELECTOR (on the rear panel) set for the wrong applied ac source voltage or if a wrong line fuse is installed.

## LINE VOLTAGE SELECTION

The 2205 operates from either a $115-\mathrm{V}$ or a 230-V nominal ac power line with any frequency from 48 Hz to 440 Hz . Before connecting the power cord to a power source, verify that the LINE VOLTAGE SELECTOR, located on the rear panel, is set correctly and that the proper line fuse is installed. Refer to Table 2-1, Figure 2-1, and the instrument rear panel.

To convert the 2205 for operation on the other line-voltage range, use a flat-bladed screwdriver to move the LINE VOLTAGE SELECTOR to the required position and install the appropriate fuse (listed on the rear panel and in Table 7-1). The detachable power cord may have to be replaced to match the particular power source.

## LINE FUSE

The fuse holder is located on the rear panel and contains the line (mains) fuse. Use the following
procedure to verify that the proper fuse is installed or to install a replacement fuse.

1. Unplug the power cord from the power source (if applicable).
2. Press in and slightly rotate the fuse-holder cap counterclockwise to release it.
3. Pull the cap (with the fuse) out of the fuse holder.
4. Verify that the fuse is the same type listed on the back of the instrument. The two types of fuses listed are not directly interchangeable; they require different types of fuse caps.
5. Reinstall the fuse (or replacement fuse) in the fuse-holder cap.
6. Replace the fuse holder and cap.

This instrument has a detachable, three-wire power cord with a three-contact plug for connection to both the power source and protective ground. The ground contact on the plug connects through the power-cord to the external metal parts of the instrument. The power cord may be secured to the rear panel by a cord-set-securing clamp as shown in Figure 2-1. For electrical shock protection, insert this plug only into a power source outlet that has a properly grounded protective-ground contact.

Instruments are shipped with the required power cord as ordered by the customer. Power cord plug information is presented in Table 2-1, and part numbers are listed in Table 7-1.

## INSTRUMENT COOLING

Maintain adequate airflow to prevent instrument damage from internally generated heat. Before turning on the power, check that the spaces around the air-intake holes on the sides of the cabinet are free of any obstruction to airflow.

Figure 2-1. Voltage Selector switch, fuse, power-cord receptacle, and plastic clamp.

## CONTROLS, CONNECTORS, AND INDICATORS

The following descriptions are intended to familiarize the operator with the location and function of the instrument's controls, connectors, and indicators.

Refer to Figure 2-2 for the location of items 1 through 28.

## POWER AND DISPLAY

INTENSITY Control-Adjusts the brightness of all displayed waveforms.
(2) BEAM FIND Button-Compresses the vertical and horizontal deflection to within the graticule area and intensifies the display to aid the user in locating traces that are overscanned or deflected outside of the crt viewing area.

FOCUS Control-Adjusts for optimum display definition. Once set, proper focusing is maintained over a wide range of display intensity.
(4) TRACE ROTATION Control-Permits alignment of the trace with the horizontal graticule line. This control is a screwdriver adjustment that, once set, should require little attention during normal operation.
(5) POWER Switch-Turns instrument power on or off.

Power On Indicator-Lights up while instrument is operating.

## VERTICAL

(7) Channel 1 Vertical POSITION ControlControls the vertical display position of the Channel 1 signal. In $\mathrm{X}-\mathrm{Y}$ mode the control is inactive.
(8) Channel 2 Vertical POSITION ControlControls the vertical display position of the Channel 2 signal. In $X-Y$ mode the control vertically positions the display.

MODE Switch CH 1-BOTH-CH 2-Selects either a single channel for display or the dualchannel display mode.

CH 1-Selects only the Channel 1 input signal for display.

BOTH-Selects a combination of Channel 1 and Channel 2 input signals for display. The CH 1 -BOTH-CH 2 switch must be in the BOTH position for ADD, ALT, and CHOP operation.

CH 2-Selects only the Channel 2 input signal for display.

MODE Switch NORM-CH 2 INVERT-Inverts the Channel 2 display when in the CH 2 INVERT position. With CH 2 inverted, the oscilloscope may be operated as a differential amplifier when the BOTH-ADD vertical mode is selected. For noninverting Channel 2 display, select NORM position.

MODE Switch ADD-ALT-CHOP-Sets the dual-channel vertical display mode.

ADD-Displays the sum of Channel 1 and Channel 2 input signals when BOTH is also selected. The difference of the Channel 1 and Channel 2 input signals is displayed when the Channel 2 signal is inverted.

ALT-Alternately displays the Channel 1 and Channel 2 input signals. The alternation occurs during retrace at the end of each sweep. ALT vertical mode is most useful for viewing both channel input signals at sweep rates of 0.5 ms per division and faster.

CHOP-Switches the display between the Channel 1 and Channel 2 vertical input signals during the sweep. The chopped switching rate (CHOP frequency) is approximately 500 kHz .
(12) CH 1 and CH 2 VOLTS/DIV Switches--Select the vertical channel deflection factors from 5 mV to 5 V per division in a 1-2-5 sequence.

1X-Front-panel marking that indicates the deflection factor set by the VOLTS/DIV switch when a signal adapter, 1 X probe, or a coaxial cable is attached to the channel input connector.

10X PROBE-Front-panel marking that indicates the deflection factor set by the VOLTS/DIV switch when a 10X probe is attached to the channel input connector.

Figure 2-2. Front panel controls, connectors, and indicators.

Variable VOLTS/DIV Controls-Provide continuously variable deflection factors between calibrated positions of the VOLTS/DIV switch. Reduces gain by at least 2.5 times at the fully counterclockwise rotation of the variable knob. A detent position at full clockwise rotation indicates the calibrated VOLTS/DIV position of the variable knob.

AC-GND-DC (Input Coupling) SwitchesSelect the method of coupling the input signal from the CH $1 O R X$ and CH 2 OR $Y$ connectors to the vertical amplifiers.

AC-Capacitively couples the input signal to the vertical deflection system. The dc component of the input signal is blocked. The lower -3 dB bandpass is 10 Hz or less.

GND-Grounds the input of the vertical deflection channel; provides a zero (ground) reference voltage display (does not ground the input signal).

DC-All frequency components of the input signal are coupled to the vertical deflection and signal acquisition systems.

CH 1 OR X and CH 2 OR Y Input ConnectorsProvide for application of signals to the inputs of the deflection systems.

In $X-Y$ mode, the signal connected to the CH 1 ORX input controls the horizontal deflection, and the signal connected to the CH 2 OR $Y$ input controls the vertical deflection.

## HORIZONTAL

POSITION Control-Positions the display horizontally in all modes.

MAG Switch-Selects X1 or X10 sweep speed.

X1-Normal sweep speed as selected by the SEC/DIV switch.

X10-Extends the SEC/DIV switch settings by a factor of 10. The fastest sweep speed can be extended to 10 ns per division.
(18) SEC/DIV Switch-Selects calibrated sweep rates from 0.5 s to $0.01 \mu \mathrm{~s}$ per division in a $1-2-5$ sequence of 21 steps. The $X-Y$ position selects the $X-Y$ mode; the $C H 1$ OR $X$ input signal produces horizontal deflection for $X-Y$ displays, and the $C H 2$ OR $Y$ input signal produces vertical deflection.

Variable SECIDIV Control-Provide continuously variable, uncalibrated sweep speeds to at least 2.5 times slower than the calibrated setting. It extends the slowest sweep speed to at least 1.25 s per division.

PROBE ADJUST Terminal-Provides an approximately $0.5-\mathrm{V}$, negative-going, square-wave signal (at about 1 kHz ) for use in compensating voltage probes and checking the vertical deflection system. The PROBE ADJUST output signal is not intended as a reference for checking either the vertical or the horizontal accuracy of the instrument.

GND Connector (ih)-Provides an auxiliary ground connection directly to the instrument chassis via a banana-tip jack.

## TRIGGER

SLOPE Switch-Selects either the positive $(\sim)$ or negative ( - ) slope of the trigger signal to start the sweep.

LEVEL Control-Selects the amplitude point on the trigger signal that produces triggering.

TRIG'D/READY Indicator-A dual-function LED indicator. In P-P AUTO and NORM trigger modes, the indicator is turned on when triggering occurs. In SGL SWP trigger mode, the indicator turns on when the trigger circuit is armed, awaiting a triggering event; it turns off again as soon as the single sweep is triggered.

Trigger MODE Switch-Determines the sweep triggering mode.

P-P AUTO-TV LINE-Triggering occurs on trigger signals having adequate amplitude and a repetition rate of about 20 Hz or faster. In the absence of a proper trigger signal, an autotrigger is generated, and the sweep freeruns.

NORM-Permits triggering at all sweep rates (an autotrigger is not generated in the absence of an adequate trigger signal). NORM trigger mode is especially useful for low-frequency and low-repetition-rate signals.

TV FIELD-Permits stable triggering on a television field signal (vertical sync). In the absence of an adequate trigger signal, the sweep freeruns. The instrument otherwise behaves as in P-P AUTO.

SGL SWP-Selects single sweepoperation.

RESET Button-Arms the trigger circuit for a single sweep. Triggering requirements are the same as in NORM trigger mode. After the completion of a triggered sweep, pressing in the SGL SWP RESET button rearms the trigger circuitry to accept the next triggering event.
(27) Trigger SOURCE Switches-Determine the source of the internal and external trigger signal for the trigger generator circuits.

CH 1-Trigger signal is obtained from the CH 1 OR $X$ input connector.

VERT MODE-Trigger signals are automatically obtained alternately from the CH 1 $O R X$ and $C H 2$ OR $Y$ input signals in ALT vertical mode. In CHOP vertical mode, the trigger signal source is the sum of the Channel 1 and Channel 2 input signals.

CH 2 -Trigger signal is obtained from the CH 2 OR Y input. The CH 2 INVERT switch also inverts the polarity of the internal Channel 2 trigger signal when the Channel 2 display is inverted.

EXT-Selects external trigger source. The actual form these triggers take is selected by the second SOURCE switch.

LINE-Routes a sample of the ac-powerline signal to the trigger circuit.

EXT/10-Divides the external signal applied to the EXT INPUT OR $Z$ connector by a factor of ten before applying it to the trigger circuit.

EXT-Routes an external signal applied to the EXT INPUT OR Z connector to the trigger circuit.

EXT=Z-Routes the signal applied to the EXT INPUT OR $Z$ connector to the $Z$-Axis amplifier rather than the trigger circuit.
(28) EXT INPUT OR Z Connector-Provides for connection of external signals either to the trigger circuit for external triggering or to the Z-Axis amplifier for intensity modulation of the crt display.

## REAR PANEL

Refer to Figure 2-3 for items 29 through 31.
(29) Fuse Holder-Contains the ac-power-source fuse. See the rear-panel nomenclature for fuse rating and line-voltage range.
(30) Detachable-Power-Cord Receptacle-Provides the connection point for the ac-power source to the instrument.

Line Voltage Selector Switch-Selects the line voltage operating range of either 115 Vac or 230 Vac .

Figure 2-3. Rear Panel.

## OPERATING CONSIDERATIONS

This part contains basic operating information and techniques that should be considered before attempting to make any measurements with the instrument.

## GRATICULE

The graticule is internally marked on the faceplate of the crt to eliminate parallax-viewing errors and to enable measurements (see Figure $2-4)$. The graticule is marked with eight vertical and ten horizontal major divisions. In addition, each major division is divided into five subdivisions. The vertical deflection factors and horizontal timing are calibrated to the graticule so that accurate measurements can be made directly from the crt. Also, percentage marks for the measurement of rise and fall times are located on the left side of the graticule.

Figure 2-4. Graticule measurement markings.

## CONNECTING SIGNALS

Signal Adapter

The signal adapter supplied with the instrument is usually the most convenient way to connect a signal to the 2205. These signal adapters are shielded to prevent pickup of electromagnetic interference. When connected to the 2205 input, a signal adapter presents $1 \mathrm{M} \Omega$ and about 100 pF impedance to the circuit under test. If this capacitance is disruptive to the circuit being tested, use the optional 10X probe.

## Waveform Fidelity and Probe Grounds

When using a probe, its ground lead must be used for accurate measurements and observations. Use the shortest ground connection possible for best waveform fidelity.

In some cases, a separate ground from the unit under test to the ground receptacle on the oscilloscope front panel can reduce interference from low-frequency hum and noise. For rough checks of larger signals, such as 5 V logic, a ground lead separate from the probe - or even the safety ground connection, which is shared with the unit under test - may work for a signal ground. Fast signal transitions will be highly distorted, and extraneous noise will be induced without the probe ground connection, and/or with extra ground connections from the 2205 to the circuit being tested.

## Probe Compensation (Optional 10X Probe)

Misadjustment of probe compensation is a common source of measurement error. Due to variations in oscilloscope input characteristics, probe compensation should be checked whenever a 10X probe is moved from one oscilloscope to another or from one channel to another on the same oscilloscope. Always compensate the probe to the channel on which it will be used. See the procedure in Section 4, Checks and Adjustments.

## Probe Handling (Optional Probes)

Both the probe and the probe accessories should be handled carefully to prevent damage. Striking a hard surface can damage both the probe body and the probe tip. Exercise care to prevent the cable from being crushed, kinked, or excessively strained.

## Coaxial Cables

To maintain good waveform fidelity and accuracy, use only high-quality, low-loss coaxial cables. When you use $50 \Omega$ or $75 \Omega$ coaxial cable, attach a matching external terminator. Some high frequency response will be lost without external termination.

## OPERATOR'S CHECKS AND ADJUSTMENTS

To verify the operation and basic accuracy of your instrument before making measurements, perform the following checks and adjustment procedures. If adjustments are required beyond the scope of these operator's checks and adjustments, refer the instrument to qualified service personnel.

For new equipment checks, before proceeding with these instructions, refer to Preparation for Use in this manual to prepare the instrument for the initial start-up before applying power.

## INITIAL SETUP

1. Verify that the POWER switch is OFF (switch is in the out position), and the Line Voltage Selector switch is set for the correct source voltage. Then plug the power cord into the ac power outlet.
2. Press in the POWER switch (ON) and set the instrument controls to obtain a baseline trace:

3. Adjust the INTENSITY and FOCUS controls for the desired display brightness and best focused trace.
4. Adjust the Vertical and Horizontal POSITION controls to position the trace within the graticule area.
5. Allow the instrument to warm up for 20 minutes before commencing the adjustment procedures. Reduce the INTENSITY level during the waiting time.

## TRACE ROTATION ADJUSTMENT

## NOTE

Normally, the trace will be parallel to the center horizontal graticule line, and TRACE ROTATION adjustment is not required.

1. Preset the instrument controls and obtain a baseline trace as described in Initial Setup.
2. Use the CH 1 POSITION control to move the baseline trace to the center horizontal graticule line.
3. If the baseline trace is not parallel to the center horizontal graticule line, use a small-bladed screwdriver or alignment tool to adjust the TRACE ROTATION control and align the trace with the graticule line.

## PROBE COMPENSATION (Option 10X Probe)

Misadjustment of probe compensation is a source of measurement error. The attenuator probes are equipped with a compensation adjustment. To ensure optimum measurement accuracy, always check probe compensation before making measurements. Probe compensation is accomplished by the following steps:

1. Preset the instrument controls and obtain a baseline trace as described in the Initial Setup.
2. Connect the two $10 \times$ probes (supplied with the instrument) to the $\mathrm{CH} 1 \mathrm{OR} X$ and CH 2 OR Y input connectors.
3. Connect the Channel 1 probe tip to the PROBE ADJUST terminal.
4. Use the CH 1 POSITION control to vertically center the display. If necessary, adjust the Trigger LEVEL control to obtain a stable display on the positive ( $-\Gamma$ ) SLOPE.

## NOTE

Refer to the instruction manual supplied with the probe for more complete information on the probe and probe compensation.
5. Check the waveform display for overshoot and rounding (see Figure 2-5); if necessary adjust the probe's compensation. Use a lowreactance alignment tool to adjust the LF comp capacitor for a square front corner on the waveform.
6. Disconnect the Channel 1 probe tip from the PROBE ADJUST terminal.
7. Connect the Channel 2 probe tip to the PROBE ADJUST terminal.
8. Set the Vertical MODE to CH 2.
9. Use the CH 2 POSITION control to vertically center the display.
10. Repeat step 5 for the Channel 2 probe.

Figure 2-5. Probe compensation.

## THEORY OF OPERATION

## SECTION ORGANIZATION

This section of the manual contains a general summary of instrument functions followed by a detailed description of each major circuit. A basic block diagram, (Figure 9-4), and the schematic diagrams are located in the tabbed Diagrams section at the back of this manual. The block diagram and schematic diagrams are used to show the interconnections between parts of the circuitry and to indicate circuit components.

The schematic diagram number associated with each description is identified in the text and is shown on the block diagrams. For best understanding of the circuit being described, refer to the appropriate schematic diagram and the block diagram.

## INTEGRATED CIRCUIT DESCRIPTIONS

## Digital Logic Conventions

Digital logic circuits do many functions within the instrument. Functions and operation of the logic
circuits are represented by logic symbology and terminology. Most logic functions are described using the positive-logic convention. Positive logic is a system where the more positive of two levels is the TRUE (or 1) state; the more negative level is the FALSE (or 0 ) state. In this logic description, the TRUE state is HI, and the FALSE state is LO. Voltage levels for a HI or a LO state vary between specific devices. For detailed device characteristics, refer to the manufacturer's data book.

## Linear Devices

The operation of individual linear integrated circuit devices in this section use waveforms or other techniques such as voltage measurement and simplified diagrams to illustrate their circuit operation.

## GENERAL DESCRIPTION

In the following functional description of the 2205 Oscilloscope, refer to the block diagram (Figure 9-4) located in the Diagrams section of this manual. In Figure 9-4 the numbered diamond symbol in each major block refers to the appropriate schematic diagram number.

## Vertical

Signals to be displayed on the crt (cathode-ray tube) are applied to either or both the CH 1 OR X and the CH 2 OR $Y$ input connectors. The signals may be coupled to the attenuator either directly (DC) or through an input-coupling capacitor (AC). The inputs may also be disconnected, and the input to the attenuators grounded, by switching to the GND position of the input coupling switch. In the GND position, the ac-coupling capacitor is allowed to precharge to the dc level present at the input
connector. This precharging prevents large trace shifts of the display when switching from GND to AC coupling. The Attenuators are switched by the front-panel VOLTS/DIV switches and scale the applied signal level to obtain the desired display amplitude.

The output signals from the Attenuators are applied to the Vertical Preamplifiers for amplification. The Channel 2 Preamplifier has additional circuitry, permitting the operator to invert the Channel 2 display on the cathode-ray tube (crt). Trigger pickoffs in each channel supply a trigger signal to the Trigger Amplifier when internal triggering is selected.

Input signals are selected for display by the Channel Switching circuit under control of the frontpanel VERTICAL MODE switches. The output signal from the Channel Switching circuit is applied to the Vertical Output Amplifier.

Final amplification of the vertical signal is done by the Vertical Output Amplifier. This stage produces the signal levels that vertically deflect the crt electron beam. For locating the position of off-screen displays, the dynamic range of the Amplifier can be limited with the Beam Find circuitry. This circuitry also intensifies the trace and limits horizontal deflection.

## Triggering

The Trigger circuitry uses either the Internal Trigger signal obtained from the input signal(s), an External Trigger signal, or a Line Trigger signal derived from the ac power source to develop trigger signals for the Sweep Generator. The P-P Auto Trigger circuit sets the range of the Trigger Level to conform to within the peak-to-peak amplitude of the selected trigger signal when either P-P Auto or TV Field Trigger mode is selected. This allows triggering on most signals without needing to adjust the TRIGGER LEVEL control. In NORM mode, the TRIGGER LEVEL control must be adjusted to the signal level before a sweep will be triggered.

The triggering circuitry contains the TV Field Sync circuit. This circuit provides stable triggering on television vertical-sync pulses when in the TV Field triggering mode. TV Line triggering is possible using P-P AUTO trigger mode.

## Sweep

The Sweep Logic circuit controls the sweep generation and $Z$-Axis unblanking for the Sweep display. When the TRIGGER Mode switches are set to either P-P AUTO or TV FIELD and no trigger signal is present, the Auto Baseline circuit causes the Sweep Logic circuit to produce a sweep for reference purposes. In the NORM setting, the Auto Baseline circuit is disabled and sweeps are not generated until a trigger event occurs. This is useful for triggering on low-repetition rate signals. The SGL SWP (single sweep) trigger mode allows only one sweep to be generated after being reset. Following the single sweep, the Trigger circuit is disabled until the SGL SWP RESET button is pressed again.

The Sweep Logic circuit controls the operation of the Miller Sweep Generator circuit. The Sweep circuit produces a linear sweep with a ramp time that is controlled by the SEC/DIV switch setting. The sweep signal is applied to the Horizontal Preamplifier for initial amplification and then to the Horizontal

Output Amplifier to drive the crt horizontal deflection plates.

## Horizontal

The Horizontal Preamplifier gain is increased by a factor of 10 when the Horizontal MAG control is used. Horizontal positioning of the display is done in the Horizontal Preamplifier circuit.

In the $X-Y$ mode of operation, the Channel 1 signal from the internal Trigger circuitry passes through the $X-Y$ Amplifier to the Horizontal Preamplifier. In this operating mode, the Channel 1 Internal Trigger signal supplies the horizontal deflection to the crt, and the Miller Sweep circuit is disabled to inhibit sweep generation.

## Z-Axis

The $Z$-Axis drive from the Sweep Logic circuit is applied to the $Z$-Axis Amplifier. The output signal from the $Z$-Axis Amplifier circuit sets the crt intensity. When using Chop Vertical mode, a blanking signal from the Chop Oscillator circuit blanks the crt display while switching between the vertical channels.

The DC Restorer circuit applies the output voltage of the Z -Axis Amplifier between the cathode and grid of the crt. High dc potentials on these elements prohibit direct coupling to the crt.

## Power Supply

The Power Supply provides the necessary operating voltages for the instrument. Operating potentials are obtained from a circuit consisting of the Power Transformer, power supply control circuits, inverter, and inverter transformer. The inverter transformer secondary windings provide various ac-levels that are rectified and filtered to produce the operating voltages for the instrument.

## Probe Adjust

A front-panel PROBE ADJUST output is provided for use in adjusting probe compensation. The voltage at the PROBE ADJUST connector is a negative-going square wave that has a peak-topeak amplitude of about 500 mV with a repetition rate about 1 kHz .

# DETAILED CIRCUIT DESCRIPTION 

## VERTICAL

## Attenuators

The Channel 1 and Channel 2 Attenuator circuits, shown on Diagram 1, are identical except for the additional Invert circuitry in the Channel 2 Paraphase Amplifier. Therefore, only the Channel 1 Attenuator is described, with the Invert circuitry of Channel 2 discussed separately.

The Attenuator circuit (see Figure 3-1) provides control of the vertical deflection factor and the variable volts/division gain. Vertical input signals for display on the crt may be connected to either or both the CH 1 OR $X$ and the $C H 2$ OR $Y$ input connectors. In the $X-Y$ mode of operation, the input signal applied to the CH 1 OR $X$ connector provides horizontal ( $X$-axis) deflection for the display, and the input signal applied to the CH 2 OR $Y$ connector provides the vertical ( $Y$-axis) deflection for the display.

## Input Coupling (AC-GND-DC)

A signal from the $\mathrm{CH} 1 \mathrm{OR} \times$ input connector may be ac or dc coupled to the High-Impedance Attenuator circuit or disconnected completely by the Input Coupling Switch. Signals from the CH 1 OR $X$ input connector are routed through resistor $R 1$ to Input Coupling switch S101. When S101 is set for dc
coupling, the Channel 1 signal goes directly to the input of the High-Impedance Attenuator stage. When ac coupled, the ac portion of the input signal passes through the dc-blocking capacitor C2. The blocking capacitor stops the dc component of the input signal from reaching the Attenuator circuit. When switched into the signal path, attenuator AT1 attenuates the input signal by factors of $100,10,4$, or 2. When S101 is set to GND, the direct signal path is opened and the input of the attenuator is connected to ground. This provides a ground reference without the need to remove the applied signal from the input connector. The coupling capacitor precharges through R2 and R4 to prevent large trace shifts when switching from GND to AC.

## Input Attenuator

The effective deflection factor of each vertical channel is determined by the setting of the Channel VOLTS/DIV switch. The basic deflection factor of the Vertical system is $5 \mathrm{mV} / \mathrm{DIV}$. For VOLT/DIV switch settings above $5 \mathrm{mV} / \mathrm{DIV}$, frequency compensated voltage dividers (attenuators) are switched into the circuit. Each channel has $\div 2, \div 4, \div 10$ and $\div 100$ attenuators that are selected in various combinations to produce the different deflection factors. Each attenuator contains an adjustable series capacitor to provide correct attenuation at high frequencies, and an adjustable shunt capacitor to provide correct input capacitance.

Figure 3-1. Block diagram of the Channel 1 Attenuator.

## Source Follower

The Channel 1 signal from the input attenuator is connected to the source follower Q13A via R6 and C6. Resistor R5 provides the input resistance. Resistor R6 provides input current limiting for Q13A and Q14. FET Q13B is a constant current source for Q13A. Transistors Q13A and Q13B provide a high output impedance for the attenuator stage and the input drive current needed for the Paraphase Amplifier U30 (first stage of amplification).

If excessively high amplitude signals are applied to the source follower Q13A, the signal current will be limited by R6 and Q14 (connected as diode) and the gate-source junction of Q13A. If an excessive negative going signal causes Q14 to become forward biased, Q13A gate is clamped to about -9.3 V . An excessive positive going signal will forward bias the gate-source junction of Q13A. As soon as gate current flows, the gate voltage will stop increasing. Gate current is limited by the high resistance of R6.

## Paraphase Amplifier

Paraphase Amplifier U30 converts the singleended signal from Q13 into a differential signal for the Vertical Preamplifier. The signal from Q13A pin 5 goes to the base of one transistor in U30. The other input transistor in U30 is biased by the divider network formed by R30, R31, R32 and variable R33. Emitter current for the two input transistors is supplied by R22 and R23. Resistor R29 sets the gain for the stage. The collector current of the two input transistors serves as emitter current for the differential output transistor pairs. Base bias voltages for the output pairs are developed by the divider network formed by R39, R41, R42 and CH 1 VOLTS/DIV Variable control. The transistors of U30 have matched characteristics, so the ratio of currents in the two transistors U83B and U83C, connected as diodes, determines the current ratios in the output transistor pairs of U30.

As CH 1 VOLTS/DIV Variable control is rotated from calibrated to uncalibrated, the conduction level of the transistors connected to R35 increases. Since the transistor pairs are cross connected, the increased conduction in one pair of transistors subtracts from the output current produced by the transistor pair connected to R38, and the overall gain of the amplifier decreases. Potentiometer R33 is adjusted to balance the amplifier for minimal dc trace shift as the CH 1 VOLTS/DIV Variable control is rotated.

Incorporated in the Channel 2 Paraphase Amplifier is circuitry that allows the polarity of the Channel 2 signal to be inverted. When CH 2 INVERT
switch S90 is in NORM, the transistor pairs in U80 are biased as they are in U30, and CH 2 trace is not inverted. In CH 2 INVERT position, connections to the bases of the output transistor pairs are reversed, to produce an inverted Channel 2 trace. Potentiometer R83 is adjusted for minimal dc trace shift in CH 2 INVERT when rotating CH 2 VOLTS/DIV Variable control. Potentiometer R84 is switched in with R83 when in INVERT; it is adjusted for minimal dc trace shift when rotating CH 2 VOLTS/DIV Variable control.

## Vertical Preamplifiers

The Channel 1 and Channel 2 Vertical Preamplifiers, shown on Diagram 2, are identical in operation. Operation of the Channel 1 amplifier is described. Differential signal current from the Paraphase Amplifier is amplified to produce drive current for the Vertical Output Amplifier. Internal trigger signals for the Trigger circuitry are picked off before the Vertical Preamplifier. The Channel Switch circuitry controls channel selection for the crt display.

Common-base transistors Q102 and Q103, which complete the Paraphase Amplifier portion of the circuitry shown on Diagram 1, convert differential current from the Paraphase Amplifier into levelshifted voltages that drive the bases of the input transistors of Vertical Preamplifier $\cup 130$ and the Internal Trigger circuitry.

Emitter current for the input transistors of $\cup 130$ is supplied by Q114 and Q115. The base bias of Q114 and Q115 is adjusted by the Channel 1 VERTICAL POSITION Control R123. The collector current of each input transistor of U130 is the emitter current for two of the differential output transistors. One collector of each output pair is grounded and the other provides output drive to the Vertical Output Amplifier. The base bias voltages of the transistors with grounded collectors are held at ground potential by R136. The base voltages of the other transistors are controlled by the Channel Switch circuitry.

When Channel 1 is selected to drive the Vertical Output Amplifier, the Q output (pin 9) of U540A is HI. The transistors with the ungrounded collectors is then forward-biased, and the Channel 1 signal is conducted through to the Vertical Output Amplifier. If Channel 1 is not selected, then the $Q$ output of U540A is LO. The transistors with the ungrounded collectors are then reverse-biased and the output signals will be conducted to ground by the other transistor pair. The gain of the Preamplifier is set by adjusting R145 to control the signal current that is shunted between the two differential outputs.

## Channel Switch Logic

The Channel Switch circuitry, shown on Diagram 2, uses the front-panel VERTICAL MODE switches to select the crt display format. See Figure 3-2 for a block diagram of the circuit.

When any display mode other than $\mathrm{X}-\mathrm{Y}$ is selected, the XY line connected to 5550 is at ground potential. VERTICAL MODE switches S545 and S550 control the connection between the XY control line and the $\operatorname{SET}(\mathrm{L})$ and $\operatorname{RESET}(\mathrm{L})$ inputs of flip-flop U540A to obtain the various display formats described below.

CHANNEL 1 DISPLAY ONLY. The CH 1 position of S550 grounds the SET input of U540A while the RESET input is held HI by pull-up resistor R539. This produces a HI and a LO on the Q and $\overline{\mathrm{Q}}$ outputs of U540A respectively, and the Channel 1 Preamplifier signal then drives the Vertical Output Amplifier (as described in the Vertical Preamplifier section). The Channel 2 Preamplifier will be disabled.

CHANNEL 2 DISPLAY ONLY. The CH 2 position of S550 holds the RESET input of U540A LO through CR538, and the SET input is held HI by pull-up
resistor R538. The outputs of U540A are then Q LO and $\overline{\mathrm{Q}} \mathrm{HI}$ enabling the Channel 2 Preamplifier signal to drive the Vertical Output Amplifier, while the CH 1 Preamplifier is disabled.

To display the ADD, ALT, or CHOP formats, S550 must be in the BOTH position to ground the $\mathrm{A}, \mathrm{C}$, and $F$ pins of S545.

ADD DISPLAY. In the ADD position of S545, both the SET and RESET inputs of U540A are held LO by CR534 and CR537. The Q and $\bar{Q}$ outputs of U540A are then both HI , and signal currents from the Channel 1 and Channel 2 Preamplifiers add together to drive the Vertical Output Amplifier.

CHOP DISPLAY. In the CHOP position, the CHOP ENABLE line is held LO, keeping the inputs of U537D and U537C HI. This enables CHOP multivibrator U537D to begin switching. The switching rate is determined primarily by the component values of R544, R545, and C545. The output of U537C (the inverted output of the multivibrator circuit) supplies the CHOP clock to flip-flop U540A via U537A. The output of U537C also drives U537B, the CHOP Blanking Pulse Generator.

Figure 3-2. Block diagram of the Channel Switching.

Coupling capacitor C547 and resistors R547 and R548 form a differentiating circuit that produces positive-going and negative-going short duration pulses. These pulses are inverted by U537B to generate the Chop Blank signal to the Z-Axis Amplifier. The pulses blank the crt during CHOP switching times.

The Alt Sync signal applied to one input of U537A is HI except during Holdoff. This allows the output of U537C to be inverted by U537A which drives the clock input of U540A. Since the $\bar{Q}$ output of U540A is connected back to the D input, and both the SET and RESET inputs are HI , the outputs of U540A toggle (change states) with each clock input. The Vertical Output Amplifier is then driven alternately from the Channel 1 and Channel 2 Preamplifiers at the CHOP rate.

ALTERNATE DISPLAY. In ALT, the CHOP ENABLE line is held HI, disabling CHOP multivibrator U537D. The output of U537C will be HI and the Chop Blank signal from U537B will be LO. Input signals to U537A are the HI from U537C and the ALT SYNC from the Holdoff circuitry in the Sweep Generator. The output of U537A will then be the inverted ALT SYNC signal that clocks Channel Select flip-flop U540A. This causes the outputs of U540A to toggle at the end of each sweep so that the Channel 1 and Channel 2 Preamplifiers alternately drive the Vertical Output Amplifier.

Beam Find keeps the vertical trace within the graticule area for locating off-screen and overscanned traces. BEAM FIND switch S390 adjusts the Vertical Output Amplifier biasing to limit the voltage swing at the crt plates. When S390 is in normal out position, the voltage level on pin 3 of U225 is about zero volts. When the BEAM FIND switch is in, pin 3 of U 225 goes to -8.6 V , the output of U 225 goes low and bias Q202 and Q203 such that the amplifier dynamic range is limited.

## Vertical Output Amplifier

The Vertical Output Amplifier provides final amplification of the input signals for application to the vertical deflection plates of the crt. Signals from the preamplifier are applied to a differential amplifier composed of Q230 and Q231 with frequency compensation provided by R241, R280, and C241, and overall gain set by R233. Transistors Q232, Q236, and Q237 form a cascade-feed-back amplifier for driving the positive deflection plate with R243 setting amplifier gain and C243 providing high frequency compensation. Emitter follower of Q232 buffers the input and provides low impedance drive to the two output transistors Q236 and Q237. For slow speed signals, Q236 serves as a current source for Q237,
and at high frequencies, the signal is coupled through C232 to the base of Q236. This provides additional pull-up output current to drive the crt at high frequencies. The amplifier consisting of Q234, Q238, and Q239 drives the negative deflection plate the same way the positive deflection plate is driven.

## TRIGGER AMPLIFIERS AND SWITCHING

The Trigger Amplifiers shown on Diagram 3, provide signals to the Trigger Generator circuit from either the Vertical Preamplifiers, the EXT INPUT OR Z connector, or the power line. The SOURCE switch selects Channel 1, Channel 2, external, or line as the trigger source.

## Internal Trigger

Signals from the Vertical Preamplifiers drive the internal Trigger Amplifier with channel selection determined by the VERTICAL switch.

Trigger pickoff from the Preamplifiers is accomplished by Q450 and Q451 for Channel 1, and Q452 and Q453 for Channel 2. The circuitry associated with Channel 2 is the same as that for Channel 1 except that it does not have a trigger offset adjustment.

Signals from the Channel 1 Preamplifier are applied to Q450 and Q451. These emitter-follower transistors each drive one input transistor in U335, and the collectors of the U335 input transistors in turn supply emitter current to two current-steering transistors. The biasing network of the input transistors of U335 is adjustable while the biasing network of the input transistors of U310 is fixed. Potentiometer R338 adjusts the emitter bias levels of the two input transistors of U335 so that dc offsets between channels can be matched.

The base bias voltage of one transistor in each output differential amplifier pair is fixed by the divider network composed of R443 and R444. The other base voltage is controlled by the CH 1 TRIG signal from the Trigger Channel Switch circuitry. When the CH 1 TRIG signal is LO, the transistors in each output pair, with the collectors connected together, are biased on and the other transistors are off. The collector signal currents are equal in magnitude but opposite in polarity and signal cancellation occurs. If the CH 1 TRIG signal is HI, the other transistors in each pair will be biased on and an output signal will be developed across R339 and R340 to drive the Internal Trigger Amplifier.

Internal trigger channels are chosen by the SOURCE switch S555. The CH 1, VERT MODE, and CH 2 positions of S555 forward biases CR348 and

CR349 to prevent external trigger signals or the line trigger signal from reaching the Trigger Generator. Signals from the Internal Trigger Amplifier are passed to the Trigger Generator through forwardbiased CR450

CHANNEL 1. For triggering from Channel 1, the SOURCE and VERTICAL MODE switches are set to CH 1 . Input pin 9 of U 300 C will be LO, which place a LO at the output of U300C. This LO is passed through U304B to an input of U300B. The output of U300B goes HI enabling Channel 1 signal through U335. The Channel 2 signal path is disabled by the output of U300A being LO.

CHANNEL 2. For triggering from Channel 2, the SOURCE and VERTICAL MODE switches are set to CH 2 . Input pin 8 of U300C will be LO, which places a LO at the output of U300C. This LO is passes through U304A to one of the inputs of U300A. The output of U300A goes HI enabling Channel 2 signal through U335. The Channel 1 signal path is disabled by the output of U300B being LO.

VERT MODE. When the SOURCE switch is set to VERT MODE, trigger source selection is determined by the two VERTICAL MODE switches. The outputs of U300A and U30OB will be HI , and triggering selection will then be determined by the inputs of $\cup 304 \mathrm{~A}$ and U304B that are controlled by U540A in the Channel Switch circuit.

When Channel 1 is selected (VERTICAL MODE switch set to CH 1 ), the input to U 304 B will be HI . The LO from the output of U304B is applied to U300B and causes the CH 1 TRIG line to go HI and enable the Channel 1 trigger signal. The input to U304A will be LO placing a HI at the input of U300A. The LO from the output of U300A causes the Channel 2 trigger signal to be disabled.

When Channel 2 is selected (VERTICAL MODE switch set to CH 2 ), the outputs of U340B, U300B, U304A, and U300A will be the reverse of the states described for Channel 1 selection. The Channel 2 signal will be selected and the Channel 1 trigger signal disabled.

When selecting ALT VERTICAL MODE; the inputs of U304A and U304B will toggle with each sweep. The outputs of the two gates will also toggle and the Trigger signal source will alternate with the displayed channel.

In the ADD VERTICAL MODE position, both inputs to U304A and U304B will be LO and both gate outputs of U300A and U300B will be HI. Both Channel 1 and Channel 2 signal paths will be enabled and their output current will be summed at the inputs of the

Internal Trigger Amplifier to produce the internal trigger signal.

In CHOP VERTICAL MODE position, the CHOP ENABLE line places a LO on both inputs of U300D. The output of U300D is held HI and applied to the inputs U304A and U304B and the signal to the Internal Trigger Amplifier will be the same as for the ADD mode.

## Internal Trigger Amplifier

The Internal Trigger Amplifier converts the differential trigger signals from the Vertical Preamplifiers into a single-ended signal that drives the X-Axis Amplifier and the Trigger Generator.

Signal current is applied to the emitters of U380C and U380D. The collector current of U380C is converted to a voltage across feedback resistor R357. The opposite-phase collector current of U380A causes a voltage drop across R359 that adds to the voltage at the collector of U380D. This voltage appears at the base of U415C which buffers and level shifts the signal back to 0 V . The emitter signal of U415C drives the X-Axis Amplifier, and the base of Q410. The emitter signal of Q410 in turn drives the Trigger Generator whenever CR450 is forward biased.

## External Trigger Amplifier

The External Trigger Amplifier buffers signals applied to the EXT INPUT OR Z connector and linefrequency trigger signals. The output of the amplifier is applied to the Trigger Generator.

EXT. When the SOLIRCE switches are set to EXT, and either EXT $=2$, EXT, or EXT/10 is selected, the trigger source is the signal applied to the EXT INPUT OR Z connector. In EXT/10 position the input signal is attenuated by a factor of 10 through the compensated divider composed of R377, R378, C377, and C378.

The external signal is applied to the gate of Q370. FET Q371 supplies source current for Q370 such that there will be no voltage drop across the gate-source junction of Q370. FETS Q370 and Q371 are a matched pair. The source-follower Q370 drives emitter-follower transistor Q412 which lowers the Amplifier output impedance. Protection-diode CR381 clamps the signal at the gate of Q370 to about -9 V . The Amplifier output will drive the Trigger Generator through forward-biased CR451 whenever the SOURCE switch is set to EXT. When the SOURCE switch is not set to EXT, the base-emitter junction of Q370 will be reverse biased via Q411, CR452, CR348 or CR349, and the Amplifier will be disabled.

When the SOURCE switch is set to EXT=Z position, the external signal is buffered by Q370 and applied to the $Z$-Axis amplifier for intensity modulation.

The line trigger from the power supply is applied to Q370 when the SOURCE switches are set to EXT and LINE positions.

## TRIGGER GENERATOR

The Trigger Generator, shown on Diagram 3, supplies trigger signals to the Sweep Generator. Included in the Trigger Generator circuit are the P-P Auto Trigger, Norm Trigger, and TV Triggering circuitry.

## Trigger Level Circuit

The Trigger Level Circuit establishes voltages at the ends of the TRIGGER LEVEL potentiometer as a function of the TRIGGER Mode switch selection and trigger signals selected be the SOURCE switch. In the P-P Auto and TV Field mode, U415E is off and CR341 is reverse biased. Diode CR417 is forward biased turning U415A off. Trigger signals selected by the SOURCE switch are applied to peak detectors consisting of U415B-Q415 and U380E-Q465. These peak detectors track dc levels and have a high voltage transfer efficiency. The positive-peak and negative-peak signal levels stored by C418 and C431 are near the peak levels of the trigger signal. Amplifiers U425A and U425B are configured as voltage followers with transistors U415D and Q490 in the feedback loops. These transistors thermally compensate for U415B and Q465 and level shift the amplifier outputs back to the original do levels of the input trigger signals. The output of U425B will be the positive peak voltage of the input trigger signal and the output of U425A will be the negative peak voltage. Potentiometers R445 and R446 adjust for dc offsets in the trigger circuitry.

In the Norm mode, +8.6 V is applied to the junction of R417 and R432, turning on U415E and forward biasing CR431. Diode CR417 is reverse biased turning U415A on. Input transistors U415B and Q465 are then biased off and no trigger signals will reach the Trigger Level circuit. The inputs and outputs of U425A and U425B will then be fixed voltages and independent of trigger-signal amplitude.

## Trigger Level Comparator

The Trigger Level Comparator compares signals selected by the TRIGGER SOURCE switch to a voltage set by the TRIGGER LEVEL control. Positive or negative slope triggering is selected by the TRIGGER SLOPE switch.

Transistors U460B and U460E compare the wiper voltage on the TRIGGER LEVEL control to the input trigger signal, and the transistor with the higher base voltage will conduct more of the available emitter current. The output collector currents supply emitter current to two transistor pairs (U460A-U460F and U460C-4600D) which serve as cross-wired switches that are biased on or off by the TRIGGER SLOPE switch. When S460 is set to the positive slope position, U460A and U460D are biased on and U460C and U460F are biased off. For the negative slope position, the transistors reverse states to invert the comparator output polarity.

## Schmitt Trigger and TV Trigger Circuit

This circuitry generates a signal that drives the Trigger Logic as a function of the Trigger Level Comparator output signal and the TRIGGER MODE switches.

The output signals from the Trigger Level Comparator drive Q400 and Q401. These transistors are configured as a current mirror that converts the differential output to a single-ended current to drive amplifier U480C. Potentiometer R481 corrects for dc offsets between positive and negative slope. Shuntfeedback amplifier U480C converts a current input to a voltage output to drive the input of the Schmitt Trigger, U480D, through R485. Positive feedback for the Schmitt Trigger is provided by potentiometer R489, and C489 reduces trigger jitter increasing positive feedback at higher frequencies. The setting of R489 determines the circuit hysteresis.

When TV FIELD is not selected, the TVF line is HI, and is buffered by Q487. Transistors Q488 and Q489 are biased off and a LO is placed on one input of U480A by R492-R493. This LO input will cause U480A to invert the output from U480D. With Q489 off, a LO will be placed on one input of U480B by R495 and U480B will also act as an inverter. The Trigger signal at the output of $U 480 \mathrm{~B}$ is therefore the same as the input signal to U480A.

When TV FIELD is selected, the TVF line is LO, and is buffered by Q847. The outputs of U480D will determine the conduction states of Q488 and Q489, and the input of U480A connected to R492 will be HI. The output of U480A will be LO and U480B will invert signal at its other input. Signals at the collector of Q489 are filtered by C495, R495, and C496 to reject

TV video information and average the TV horizontalsync pulses. Setting the trigger-level threshold near the center of the horizontal-sync-pulse swing establishes the untriggered level. When the TV vertical-sync-block occurs, the output of the filter applied to U480B pin 7 rises to a level that will cause U480B to switch. Precise TV field synchronization is obtained as a result of this filtering action. The Trigger signal output will be the inverse of the filtered signal appearing at U480B pin 7.

## SWEEP GENERATOR AND LOGIC

The Sweep Generator and Logic circuitry, shown on Diagrams 4 and 5, produce a linear voltage ramp that drives the Horizontal Preamplifier. The Sweep Generator circuit also produces signals that are used to generate correct timing of the crt unblanking and intensity levels used for viewing the display. See Figure 3-3 for the block diagram of the Sweep Generator and Logic circuitry.

## Miller Sweep Generator

The Miller Sweep Generator produces a linear voltage ramp that drives the Horizontal Amplifier. It produces the ramp voltage by maintaining a constant current through timing capacitors, causing a linear voltage rise across them as they charge.

Field-effect transistors Q704A and Q704B are matched devices with Q704B acting as the current source for Q704A. Since the gate and source of Q704B are connected together, the source current available to Q704A is just enough so that there is no voltage drop across the gate-source junction of Q704A.

When the sweep is not running, Q701 is biased on, holding the selected timing capacitors in a discharged state. The low impedance of Q701 in the feedback path holds the Miller Sweep output near ground potential. The voltage across Q701, in addition to the base-emitter voltage of Q706, prevents saturation of the output device.

Figure 3-3. Block diagram of the Sweep Generator and Logic.

The sweep ramp starts when Q536 is biased off. The GATE signal going to the base of Q701 from the Sweep Logic circuit turns Q701 off. The timing capacitors then begin charging at a rate set by timing resistors R701, R702 and the position of the SEC/DIV switch S701. One end of timing resistor R701 is connected to the wiper of R721 and the other end is connected to the input of the Miller integrator. Due to feedback from the circuit output through the timing capacitors, the integrator input voltage at the gate of Q704A remains fixed and sets a constant voltage across the timing resistors. This constant voltage produces a constant charging current through the timing capacitors, which results in a linearly increasing voltage ramp at the output of the Miller Sweep circuit.

When the ramp reaches about 12 V , the Sweep Logic circuitry starts the holdoff period in which Q701 is turned on and the Sweep Generator is reset. This holdoff period is necessary so that the timing capacitors can be fully discharged before another sweep starts. Capacitors C704 and C703 are always in the charging circuit and are used for high sweep speeds. For medium sweep speeds, capacitors C701 and C702 are in series. For slow sweep speeds, only capacitor C701 is used.

The SEC/DIV Variable circuitry uses an operational amplifier to maintain a constant reference voltage at one end of R721 independent of the circuit load. The voltage applied to the timing resistors varies with the rotational position of R721, the SEC/DIV Variable control. A fixed dc voltage is applied to the noninverting input of the operational amplifier, and feedback resistors R717 and R718 establish double that voltage at the anode of VR719. Potentiometer R722 adjusts the reference voltage when in 0.5 ms to $10 \mu \mathrm{~s}$ SEC/DIV ranges to correct for mismatch between timing capacitors C701 and C702.

## Sweep Logic

The Sweep Logic circuitry controls sweep generation, as a function of incoming trigger signals and the Trigger mode selected.

NORM. When NORM trigger is selected, the circuit is ready to start the sweep in response to a trigger signal. At the start of the sweep, a U530B has a LO on SET (pin 12), RESET (pin 13), and D input (pin 10). A trigger pulse received at U530B (pin 11) will clock the LO on the D input to the Q output and enable the sweep to start. The output of the sweep generator is fed back via W701-4 into the potential divider R501 and R502. This divider is arranged so that when the ramp voltage reaches about 12 V , U560E is turned on, producing a LO on the input of
inverter U520A. The inverted signal of U520A is applied to the input of U520B. The signal from U520B is inverted by U520C to produce an OR function, then fed to the SET input (pin 12) of U530B. This overrides the CLOCK input of U530B and puts a HI on the Q output (pin 15), resetting the sweep. The sweep reset is also fed to the input (pin 12) of the monostable U500B, which gives a holdoff time dependent on the holdoff capacitor selected and the variable holdoff resistor chain. The holdoff pulse from the monostable maintains the HI on the SET input of U530B until the end of the holdoff period, then the SET is driven LO, allowing the next trigger pulse to start the sweep.

P-P AUTO. In the P-P AUTO mode, the sweep will free-run in the absence of a trigger signal. Should there be more than 50 ms between trigger pulses, the Auto Baseline circuitry consisting of U580B, U520D, U570A and U570B will start a sweep. U580B is a 20 Hz clock pulse generator. This signal is passed through Schmitt trigger U520D to provide a fast rise time. This is to ensure that both $D$ inputs of U570A and U570B switch at the same time.

With no trigger signal, the first clock pulse from U580B resets U570A, putting a HI on D input of U570B. This will then be clocked (giving a LO on TRIGGERED) when the next 50 ms pulse arrives. If the end of sweep has occurred and the holdoff period has elapsed, then the output of U520C will be LO. Because TRIGGERED and P-P AUTO are both LO, the output of U550D will put a LO on pin 7 of U550B. As the other input is also LO, the output of U550B will put a HI on pin 13 of U530B, forcing GATE LO and starting a sweep.

If a trigger occurs, the HI on the D pin of U570A is passed to the Q output of U570A, to resets U570B, and put a HI on the TRIGGERED line. The output of U550B will be LO, allowing U530B to respond to the next trigger signal. When the TRIGGERED line is HI, the TRIG'D/READY LED is turned on via U550A.

SINGLE SWEEP. When the SINGLE SWEEP mode is selected, the SINGLE SWEEP line is LO, holding the D input of U570A LO and effectively disabling the Auto Baseline circuitry. This action also puts a LO on the TRIGGERED line. At the end of a sweep, the holdoff pulse is latched by U530A via U520B and U550C, and the D input of U530B is driven HI and the sweep is disabled. The sweep is enabled by a pulse from the single shot monostable U500A, which clocks the LO on the D input of U530A to the Q output. With a LO at the Q output of U530A, the next trigger signal will start a sweep. Switch debounce circuit U500A along with the timing components R506 and C506 will give a pulse width of about 30 ns , which is shorter than the fastest sweep speed. U500A also sets U510B turning on the TRIG'D/READY LED via U550A. When the holdoff period starts (and

U500A has timed out), U500B will clock a LO back onto the Q output of U540B, allowing the TRIG'D/ READY LED to be extinguished.
$X-Y$. In the $X-Y$ mode of operation, the $\overline{X Y}$ line is LO, holding the input of U520A LO through CR521. The output of U520A via U520B and U520C will hold U530B set and no sweep can be started.

## HORIZONTAL

The Horizontal Amplifier circuit, shown on Diagram 5 provides the output signals that drive the horizontal crt deflection plates. Signals applied to the Horizontal Preamplifier can come from either the Miller Sweep Generator (for sweep deflection) or from the $X Y$ Amplifier (when $X-Y$ display mode is selected). See Figure 3-4 for the block diagram of the Horizontal Amplifier.

The Horizontal Position control, X10 magnifier circuitry, and the horizontal portion of the Beam Find circuitry are also contained in the Horizontal Amplifier Circuit.

## X-Y Amplifier

In the $X-Y$ mode of operation, the $X Y$ signal (buffered by Q736) is low, biasing Q732 in the linear region. Transistors Q732 and Q737 are a transconductance amplifier that changes an input voltage to output current. The input signal is applied through gain adjust R395. The X Offset adjustment is R736. The signal current flowing out of Q737 is fed into the shunt feedback stage. The sweep is held at a constant low output level when in $X-Y$ mode.

When in sweep mode, the XY line is high and biases Q732 off, that biases Q737 off and disables the $X Y$ amplifier. The $\overline{X Y}$ line also turns on U380B, thereby not allowing the $X$ axis signal to get to the amplifier. The sweep signal is applied through R740 and the gain setting resistor (R744) to the Horizontal Preamplifier stage.

## Horizontal Preamplifier

The Horizontal Preamplifier amplifies input signals for application to the Horizontal Output Amplifier.

Figure 3-4. Block diagram of the Horizontal Amplifier.

The preamplifier is a cascode differential pair. The gain is set by the network connected between pins 7 of U755C and 10 of U755D. With MAG switch S601 in X1, the X1 MAG line is high, Q760 and U745E are off, and the current sources consisting of U745A and U755A are on for normal operation with the gain set by R763. When MAG switch is X10, the X1 MAG signal is LO, Q760 and U745E saturate, and the current sources consisting of U755B and U745B are on. This forward biases CR773 and CR774, a low impedance is switched in, and the X10 timing adjustment is made using X10 Mag Gain R777. Magnifier registration is adjusted by R782 so that there is no horizontal trace shift when switching between the X10 and X1 positions. The X1 MAG line is held at a constant high when in $X-Y$ mode.

The sweep signal, or the X-Axis signal (depending on mode of operation) with the horizontal position signal from R726, is buffered by Q750 and Q759 and applied pin 6 of U745C. Pin 9 of U745D is held to a fixed voltage level by Q725. The horizontal position signal adjusts the trace horizontally in both the sweep and $X-Y$ modes.

## Horizontal Output Amplifier

The Horizontal Output Amplifier provides final amplification of the horizontal signal to drive the horizontal crt deflection plates.

Signals from the Horizontal Preamplifier circuit are used to drive two shunt feedback amplifiers. The feedback makes the input impedance of these amplifiers low. The base voltages of Q770 and Q780 are at nearly the same do level due to forwardbiased diodes CR781 and CR791 between the two emitters.

Transistors Q770, Q775, and Q779 form a cascode feedback amplifier for driving the right horizontal crt deflection plate with R784 and R785 setting amplifier gain and C783 providing high frequency compensation. For low-speed signals Q779 serves as a current source for Q775, and at high sweep rates, the ramp is coupled through C785 to the emitter of Q779. This provides additional pull-up output current to drive the crt at high sweep rates. The amplifier, consisting of Q780, Q785, and Q789, drives the left horizontal crt deflection plate as described above with zener diode VR792 level shifting the collector signal of Q780.

The BEAM FIND function is turned on when S390 is closed and the Beam Find signal is connected to the negative supply. Q776 saturates, the cathode voltage of VR776 goes negative, and CR780 and CR890 become forward biased. Current though these diodes causes the output common-mode
voltage of the two shunt-feedback amplifiers to be shifted positively to reduce the available voltage swing at the crt plates. This prevents the trace from being deflected off-screen horizontally.

## Z-AXIS AMPLIFIER

The Z-Axis Amplifier, shown on Diagram 7, controls the crt intensity level via several input-signal sources. The effect of these input signals is either to increase or decrease trace intensity or to completely blank portions of the display. The Z-Axis signal current, as determined by the $Z$-Axis switching logic and the input current from the EXT INPUT OR Z connector (if in use), are summed at the emitter of common-base amplifier Q825 and thereby sets the collector current of the stage. The common-base amplifier provides a low-impedance termination for the input signals and isolates the signal sources from the rest of the Z-Axis Amplifier.

Common-base transistor Q829 passes a constant current through R832. This current is divided between Q825 and Q829, with the portion through Q829 driving the shunt-feedback output amplifier formed by Q835, Q840, and Q845. The bias level of Q825 therefore controls the emitter current available to Q829. The shunt feedback-resistors of R841 and R843 sets the transresistance gain for changing the input current to a proportional output voltage. Emitter-follower Q835 is dc coupled to Q840 and, for low-speed signals, Q845 acts as a current source. Fast transitions couple through C845 providing added current gain through Q845 for fast voltage swings at the output of the Amplifier.

External Z-Axis input voltages establish proportional input currents through R823, and Amplifier sensitivity is determined by the transresistance gain of the shunt-feedback amplifier.

The INTENSITY potentiometer controls the base voltage of Q804 to set the amount of emitter current that flows through that transistor and, therefore, the level of the $Z$-Axis signal.

When the sweep is displayed, the emitter of Q817 is LO, causing CR817 to be reverse biased. This allows the current through R818 to flow through CR818 and turn on the Z-Axis.

When $X-Y$ is displayed, CR817 is forward biased, reverse biasing CR818. Transistor Q818 is reverse biased allowing the intensity to be set by the current through R820 and CR820.

When CHOP VERTICAL MODE is selected, the CHOP BLANK signal is sent to the collector of Q825 through CR824 during the display-switching time. Diode CR825 is reverse biased and the forward bias
of Q829 rises to the blanking level. When blanked, the output of the Z -Axis Amplifier drops to reduce the crt beam current below viewing intensity.

When the BEAM FIND button is pressed, the BEAM FIND line goes to about -8 V sinking about 1 mA from the $Z$-Axis Amplifier, over-riding any other current combinations, and therefore unblanking the trace.

## DC Restorer

The DC Restorer circuit sets the crt control-grid bias and couples the ac and dc components of the Z-Axis Amplifier output to the crt control grid. Direct coupling of the $Z$-Axis Amplifier output to the crt control grid is not employed because of the high potential differences involved. Refer to Figure 3-5 during the following discussion.

Ac drive to the $D C$ Restorer circuit is obtained from pin 3 of T902. The drive voltage has an ac peak amplitude of about 100V, at a frequency of about 20 kHz and is coupled into the DC Restorer circuit through C853 and R853. The cathode of CR851 is biased by the wiper voltage of Grid Bias potentiometer R851, and the ac drive voltage is clamped whenever the positive peaks reach a level that forward biases CR851.

The Z-Axis Amplifier output voltage, which varies between +10 V and +75 V , is applied to the DC Restorer at the anode of CR853. The ac drive voltage holds CR853 reverse biased until the voltage falls below the $Z$-Axis Amplifier output voltage level. At that point, CR853 becomes forward biased and clamps the junction of CR851, CR853, and R854 to the $Z$-Axis output level. Thus, the ac-drive voltage is clamped at two levels to produce a square-wave signal with a positive dc-offset level.

Figure 3-5. Simplified diagram of the Dc Restorer.

The DC Restorer is referenced to the -1.8 kV crt cathode voltage through R858 and CR854. Initially, both C855 and C854 charge up to a level determined by the difference between the Z-Axis output voltage and the crt cathode voltage. Capacitor C855 charges from the Z-Axis output through R858, CR854, and CR855, to the crt cathode. Capacitor C854 charges through R858, CR854, R854, and CR853 to the crt cathode.

During the positive transitions of the ac drive, from the lower clamped level toward the higher clamped level, the charge on C854 increases. The voltage increase across C854 is equal to the amplitude of the positive transition. The negative transition is coupled through C854 to reverse bias CR854 and to forward bias CR855. The increased charge of C854 is then transferred to C855 as C854 discharges toward the Z-Axis output level. Successive cycles of the ac input to the DC Restorer charge C855 to a voltage equal to the initial level plus the amplitude of the clamped square-wave input.

The added charge held by C855 sets the controlgrid bias voltage. If more charge is added to that already present on C855, the control grid becomes more negative, and less crt writing-beam current flows. Conversely, if less charge is added, the control-grid voltage level becomes closer to the cathode-voltage level, and more crt writing-beam current flows.

During periods that C854 is charging, the crt control-grid voltage is held constant by the long time-constant discharge path of C855 through R860.

Fast-rise and fast-fall transitions of the Z-Axis output signal are coupled to the crt control grid through C855 to start the crt writing-beam current toward the new intensity level. The DC Restorer output level then follows the Z-Axis output-voltage level to set the new bias voltage for the crt control grid.

Neon lamps DS858 and DS856 protect the crt from excessive grid-to-cathode voltage if the potential on either the control grid or the cathode is lost for any reason.

## CRT Supply

The voltage doubler of CR975, CR976, and C980 produces -1.8 kV for the crt cathode. The -1.8 kV supply is filtered by a low-pass filter formed by R976, R978, C976, and C979.

## Focus Circuit

Focus voltage is developed from the -1.8 kV supply by a voltage divider formed by R894 and R892 and FOCUS potentiometer R893.

## POWER SUPPLY AND PROBE ADJUST

The Power Supply circuitry converts the ac power line voltage into the voltages needed for instrument operation. It consists of Ac Power Input, Start-Up, Current Control, Regulator, and Inverter circuits on the primary side of the high frequency power transformer. The secondary side of the high frequency power transformer provides the necessary supply voltages for the instrument. See Figure 3-6 for the block diagram of the Power Supply.

## Ac Power Input

LINE SWITCHING. Ac line voltage of either 115 V or 230 V may provide the primary power for the instrument, depending on the setting of the LINE VOLTAGE SELECTOR switch S902. POWER switch S901 connects the selected line voltage to the primary winding of the transformer T901 via fuse F901. The ac line voltage is filtered by L901, L902, C903, C904, and C905.

LINE RECTIFIER. The secondary of T901 is rectified by CR901, CR902, CR903, and CR904 and filtered by C900. The rectified voltage is about 60 V and is applied to the power supply Start-Up circuit and Current Source.

## Start-UP

The control circuits for the power supply require a separate power supply to operate. The independent power supply consists of Q982, Q985, Q988, and associated components.

Initially, when instrument power is applied, the positive plate of capacitor C982 is charged toward the 60 V supply through the resistor string R984, R983, and R970.

When the voltage across C982 reaches about 45 V , a 3 V drop occurs across R987 causing Q985 and Q988 to conduct. The collector current of Q985 passes through VR982, placing 16 V at the base of the emitter follower Q982. Emitter of Q982 drives the 15 V supply. This allows current flow through R989 to the base of Q988, keeping it on. Transistor Q988 is now being kept on by the 15 V supply instead of the 45 V across C982. As long as the 15 V supply remains above the 12 volt level, the positive feedback through R989 will keep Q988 saturated.

Figure 3-6. Block diagram of the Power Supply.

After the initial startup, current passed by Q982 is applied through CR980 via R971 and R980 instead of C982. If there is not enough current to C982, the 15 V supply will drop below the 12 V level turning off Q982, Q985 and Q988.

## Current Source and Current Switching

The Current Source and Current Switching circuits provides a regulated dc current that produces 20 V for the high frequency power transformer T902 from the 60 V supply.

CURRENT SOURCE. The Current Source circuit is made up of power MOSFET Q933, inductor L950 and associated components. This circuit provides a triangle-shaped current pulse on top of the dc current (about 1.5 A ) to transformer T902. The peak amplitude of the triangle-shaped current pulse is determined by the load requirements. The rise time varies with the voltage level of the $60 \mathrm{~V}(45 \mathrm{~V}$ to 75 V ); the fall time is fixed at $8 \mu \mathrm{~s}$.

A triangle current signal is developed across L950 by the switching of Q933. With MOSFET Q933 turned on, the $60 \vee$ supply from the line rectifier is
applied to one end of L950 via Q933. The other end of L950 is held to 20 V by the capacitive load that is reflected through the high frequency power transformer T902. With a 40 V difference across L950, the current in the inductor increases (rising portion of the triangle-shaped current pulse) until Q933 is turned off by the Current Switch circuit. With Q933 turned off, the stored current in L950 will continue to flow to the center tap of T902. The current decreases with the falling portion of the triangle current pulse. Diode CR950 becomes forward biased clamping Q933 drain to ground. This puts 20 V across L950, opposing the current flow. When Q933 turns on, CR950 becomes reversed biased and 60 V supply is applied to L950 again.

CURRENT SWITCHING. The Current Switching circuit applies the TURN OFF signal from the Regulator circuit to the Current Source circuit. The TURN OFF signal controls the load current through L950. The circuit consist of Q935, Q932, and associated components.

When the power is first turned on, C933 is uncharged and the emitter voltage of Q935 is LO ( 0 V ). Capacitor C933 quickly charges toward the 60 V supply through VR932 and VR933. When C933 is
charged to the 60 V supply, the source-gate voltage of Q933 is 0 V , turning it off.

Eventually, the 15 V supply comes up. The TURN OFF signal at the base of Q935 goes LO due to insufficient current passing through L950. Transistor Q932 will now start draining some charge from C933, reducing the voltage on C933 enough to turn on Q933. C933 continues to discharge until the voltage across the source-gate of Q933 reaches 9 V causing zeners VR932 and VR933 to conduct.

When the current through L950 reaches a high enough value, the TURN OFF signal to Q935 goes HI ( 15 V ). The 15 V is applied to one end of C933 through Q935. Since the voltage across a capacitor cannot change instantly, the voltage at the top end of C933 makes the same 15 V upward step change. The voltage at the gate of Q933 is now 6 V higher than its source ( 60 V supply), turning Q933 off. The 15 V level also turns off Q932. When the TUIRN OFF signal goes LO, Q932 and Q933 turns on again and the cycle repeats.

## Regulator

The Regulator Circuit senses the -8.6 V from the secondary of T9O2 and load current from the inverter circuit to develop a TURN OFF signal for the Current Control and Inverter circuits.

The -8.6 V from the secondary is applied to one end of R916-8.6 V potentiometer. The potentiometer R916 sets the reference voltage for U910B. The dc error voltage from U910B is filtered for any ac components by capacitor C925. Zener VR925 clamps the dc error voltage to 3 V and limits the amount of load current from the Current Source to about 3 amps. The dc error voltage is applied to pin 2 of Comparator U920.

The dc error voltage is proportional to the power requirements of the load. For instance, an increase in the load will lower the -8.6 V increasing the amplitude of the dc error voltage. An increase in the amplitude of the dc error voltage means that more current is needed to maintain the -8.6 V level.

Load current from Inverter circuitry is converted to a voltage level by R910 and applied to pin 3 of U910A. The voltage amplification of U910A is 1 V per ampere of load current. This voltage level represents the instantaneous value of load current.

The voltage level on pin 3 of U920 is compared to the dc error voltage on pin 2 of U920. As long as the voltage level on pin 3 remains below the dc error voltage on pin 2 , the output of $U 920$ will be high. The high from U920 will not trigger the monostable pulse
generator U930. This will hold the output of U930 in a low state and keep Q933 turned on. The load current will continue to increase until the voltage level on pin 3 exceeds the dc error voltage on pin 2 causing the output of U920 to change state from HI to LO. This LO is applied to pin 2 (trigger input) of U930. The TURN OFF signal from the output of U930 goes HI for a predetermined length of time (about $8 \mu \mathrm{~s}$ ).

With the Current Source (Q933) turned off, the load current voltage from U910A decreases below the level of the dc error voltage. This will put a high on the output of U920 and, when U930 times out, the TUIRN OFF signal goes back to LO and starts the cycle over again.

## Inverter

The Inverter circuit alternately switches current through each leg of the primary winding of the output transformer T902. This switching action produces ac currents in the secondary windings of the output transformer. The inverter circuit consists of D-type, flip-flop switches and power switches connected as discrete Darlington pairs.

The TURN OFF signal from U930 clocks D-type flip-flop U940. The $Q$ and $\bar{Q}$ output of U940 are inverted from each other, and change state only on the leading edge of the clock signal. Although the on time of the pulse generator is not identical to the off time, the period of the on time plus the off time is the same from one cycle to the next. The output switching of U940 will produce a square wave with a $50 \%$ duty cycle to the inverter switches.

The two outputs of U 940 are applied to the drivers Q939 and Q943. The drivers turn the power switches (Q941 and Q942) (Q945 and Q946) on and off alternately to produce an ac voltage in the secondary winding of the output transformer.

When Q output of U940 goes HI, power switch Q939 conducts and pulls the collector and one end of R941 to 0 V . The base of Q941 and Q942 goes to $-2 \vee$ causing the emitter-base to become reverse biased turning the inverter switch off. When $Q$ output goes LO, Q939 turns off and inverter switch emitter to base becomes forward biased, turning it on. The output of $\bar{Q}$ performs in the same way as $Q$ output for the other leg of the primary winding of the output transformer.

## Low-Voltage Supplies

The secondary windings of T902 provides various ac voltages for rectification. The 200 V supply uses a voltage doubler consisting of CR983, CR984, C985, and C983. The 100 V is rectified by CR985 and filtered by C984. The diode bridge consisting of

CR986, CR987, CR988, and CR989 produces the 8.6 V and -8.6 V . Filtering of the 8.6 V is done by C986, C987 and L986; filtering of the -8.6 V is done by C988, C989 and L988. The 5.2 V supply is produced by CR990 and CR991 and filtered by C990, C991, and L990.

## CRT Supply

The 900 V from the high-voltage winding of T902 is doubled by C980, CR975, and CR976 to produce -1.8 kV for the crt cathode. The -1.8 kV supply is filtered by a low-pass filter formed by R976, R978, C976, and C979. Neon lamps DS853 and DS856 protect against excessive voltage between the crt cathode and crt grid by conducting if the difference exceeds about 180 V .

## Focus Circuit

Focus voltage is also developed from the -1.8 kV supply by a voltage divider formed by R892, R894, FOCUS potentiometer R893, R888, R889, R890, and R891.

## Line Signal

Transistor Q900 is a floating differential amplifier with a dc bias network comprising R905, R904 and R902. Resistors R906 and R903 apply a small line frequency signal from the secondary of T901 to the base-emitter junction of Q900. The resultant collector current of Q900 is a line-frequency sine-wave that is applied to the trigger circuit.

## Probe Adjust

The Probe Adjust circuitry, shown on Diagram 4, is a square-wave generator and diode switching network that produces a negative-going square-wave signal at PROBE ADJUST connector J590. Amplifier U580a forms a multivibrator that has an oscillation period set by the time constant of R587 and C587. When the output of the multivibrator is at the positive supply voltage, CR588 is forward biased. This reverse biases CR589, and the PROBE ADJUST connector signal is held at ground potential by R590. When the multivibrator output switches states and goes to the negative supply voltage level, CR588 is reverse biased. Diode CR589 becomes forward biased, and the circuit output level drops to about -0.5 V .

# PERFORMANCE CHECK PROCEDURE 

## INTRODUCTION

## PURPOSE

The Performance Check Procedure is used to verify the instrument's Performance Requirements statements listed in Table 1-1 and to determine the need for calibration. The performance checks may also be used as an acceptance test or as a preliminary troubleshooting aid.

## PERFORMANCE CHECK INTERVAL

To ensure instrument accuracy, check its performance after every 2000 hours of operation, or once each year if used infrequently. A more frequent interval may be necessary if the instrument is subjected to harsh environments or severe usage.

## STRUCTURE

The Performance Check Procedure is structured in subsections to permit checking individual sections of the instrument whenever a complete Performance Check is not required. At the beginning of each subsection there is an equipment-required list showing only the test equipment necessary for performing the steps in that subsection. In this list, the Item number that follows each piece of equipment corresponds to the Item number listed in Table 4-1.

Also at the beginning of each subsection is a list of all the front-panel control settings required to prepare the instrument for performing Step 1 in that subsection. Each succeeding step within a particular subsection should then be performed, both in the sequence presented and in its entirety, to ensure that control-setting changes will be correct for ensuing steps.

## TEST EQUIPMENT REQUIRED

The test equipment listed in Table $4-1$ is a complete list of the equipment required to accomplish both the Performance Check Procedure in this
section and the Adjustment Procedure in Section 5. Test equipment specifications described in Table 4-1 are the minimum necessary to provide accurate results. Therefore, equipment used must meet or exceed the listed specifications. Detailed operating instructions for test equipment are not given in this procedure. If more operating information is required, refer to the appropriate test equipment instruction manual.

When equipment other than that recommended is used, control settings of the test setup may need to be altered. If the exact item of equipment given as an example in Table $4-1$ is not available, check the Minimum Specification column to determine if any other available test equipment might suffice to perform the check or adjustment.

## LIMITS AND TOLERANCES

The limits and tolerances given in this procedure are valid for an instrument that is operating in and has been previously calibrated in an ambient temperature between $+20^{\circ} \mathrm{C}$ and $+30^{\circ} \mathrm{C}$. The instrument also must have had at least a 20 -minute warm-up period. Refer to Table 1-1 for tolerances applicable to an instrument that is operating outside this temperature range. All tolerances specified are for the instrument only and do not include testequipment error.

## PREPARATION FOR CHECKS

It is not necessary to remove the instrument cover to accomplish any subsection in the Performance Check Procedure, since all checks are made using operator-accessible front- and rearpanel controls and connectors.

The most accurate display checks are made with a stable, well-focused, low-intensity display. Unless otherwise noted, adjust the INTENSITY, FOCUS, and Trigger LEVEL controls as needed to view the display.

Table 4-1
Test Equipment Required

| Item and Description | Minimum Specification | Purpose | Example of Suitable Test Equipment |
| :---: | :---: | :---: | :---: |
| 1. Calibration Generator | Standard-amplitude signal levels: 5 mV to 50 V . Accuracy: $\pm 0.3 \%$. <br> High-amplitude signal levels: 1 V to 60 V . Repetition rate: 1 kHz . <br> Fast-rise signal level: 1 V . Repetition rate: 1 MHz . Rise time: 1 ns or less. Flatness: $\pm 0.5 \%$. | Signal source for gain and transient responses. | TEKTRONIX PG 506 Calibration Generator. ${ }^{\text {a }}$ |
| 2. Leveled Sine-Wave Generator | Frequency: 250 kHz to above 100 MHz . Output amplitude: variable from 10 mV to 5 V p-p. Output impedance: $50 \Omega$. Reference frequency: 50 kHz . Amplitude accuracy: constant within $3 \%$ of reference frequency as output frequency changes. | Vertical, horizontal, and triggering checks and adjustments. Display adjustments and Z-Axis check. | TEKTRONIX SG 503 Leveled Sine-Wave Generator.a |
| 3. Time-Mark Generator | Marker outputs: 10 ns to 0.5 s . Marker accuracy: $\pm 0.1 \%$. Trigger output: 1 ms to $0.1 \mu \mathrm{~s}$, time-coincident with markers. | Horizontal checks and adjustments. Display adjustment. | TEKTRONIX TG 501 Time-Mark Generator. ${ }^{\text {a }}$ |
| 4. Test Oscilloscope with 10X Probes | Bandwidth: de to 50 MHz , Minimum deflection factor: $5 \mathrm{mV} / \mathrm{div}$. Accuracy: $\pm 3 \%$. | General troubleshooting, holdoff check. | TEKTRONIX 2225 Oscilloscope. |
| 5. Digital Voltmeter (DMM) | Range: 0 to 250 V . Dc voltage accuracy: $\pm 0.15 \%, 4-1 / 2$ digit display. | Power supply checks and adjustments. Vertical adjustment. | TEKTRONIX DM 501A Digital Multimeter. ${ }^{\text {a }}$ |
| 6. Coaxial Cable (2 required) | Impedance: $50 \Omega$. Length: 42 in. Connectors: BNC. | Signal interconnection. | Tektronix Part Number 012-0057-01. |
| 7. Dual Input Coupler | Connectors: BNC female-to-dual-BNC male. | Signal interconnection. | Tektronix Part Number 067-0525-01. |
| 8. Termination | Impedance: $50 \Omega$ Connectors: BNC. | Signal termination. | Tektronix Part Number 011-0049-01. |
| 9. $10 \times$ Attenuator | Ratio: 10X. Impedance: $50 \Omega$. Connectors: BNC. | Vertical compensation and triggering checks. | Tektronix Part Number 011-0059-02. |
| 10. Adapter | Connectors: Miniature probe tip to BNC adapter. | Signal interconnection. | Tektronix Part Number 013-0084-02. |
| 11. Alignment Tool | Length: 1-in. shaft. Bit size: 3/32 in. Low Capacitance: insulated. | Adjust variable capacitors. | Tektronix Part Number 003-0675-00. |
| 12. 10X Probe | Bandwidth: 50 MHz . Length: 2 m . | Probe Adjust check. | Tektronix P6103 |

Midrange P-P AUTO VERT MODE

## PROCEDURE STEPS

1. Check Deflection Accuracy and Variable Range
a. Connect a $20-\mathrm{mV}$ standard-amplitude signal from the calibration generator via a $50-\Omega$ coaxial cable to the CH 1 OR X input connector.
b. CHECK-Deflection accuracy is within the limits given in Table 4-2 for each CH 1 VOLTS/DIV switch setting and corresponding standardamplitude signal. When at the $20-\mathrm{mV}$ VOLTS/DIV switch setting, rotate the CH 1 VOLTS/DIV Variable control fully counterclockwise and check that the display decreases to 2 divisions or less. Then return
the CH 1 VOLTS/DIV Variable control to the CAL detent and continue with the $50-\mathrm{mV}$ check.
c. Move the cable from the $\mathrm{CH} 1 \mathrm{OR} X$ input connector to the CH 2 OR $Y$ input connector. Set the Vertical MODE switch to CH 2.
d. Repeat part busing the Channel 2 controls.
e. Disconnect the test equipment from the instrument.

## 2. Check Bandwidth

a. Set:

| VOLTS/DIV (both) | 5 mV |
| :--- | :--- |
| SEC/DIV | 10 ms |

Table 4-2
Deflection Accuracy Limits

| VOLTS/DIV <br> Switch <br> Setting | STANDARD <br> Amplitude <br> Signal | ACCURACY <br> Limits <br> (Divisions) |
| ---: | :---: | :---: |
| 5 mV | 20 mV | 3.88 to 4.12 |
| 10 mV | 50 mV | 4.85 to 5.15 |
| 20 mV | 0.1 V | 4.85 to 5.15 |
| 50 mV | 0.2 V | 3.88 to 4.12 |
| 0.1 V | 0.5 V | 4.85 to 5.15 |
| 0.2 V | 1 V | 4.85 to 5.15 |
| 0.5 V | 2 V | 3.88 to 4.12 |
| 1 V | 5 V | 4.85 to 5.15 |
| 2 V | 10 V | 4.85 to 5.15 |
| 5 V | 20 V | 3.88 to 4.12 |

b. Connect the leveled $\sin \theta$-wave generator output via a $50-\Omega$ coaxial cable and a $50-\Omega$ termination to the CH 2 OR $Y$ input connector.
c. Set the generator to produce a $50-\mathrm{kHz}$, 6-division display.
d. Increase the signal frequency until a 4.2-division display is obtained.
e. CHECK-The frequency is greater than 20 MHz .
f. Repeat parts c through e for all VOLTS/DIV settings from 10 mV to 5 V , up to the output-voltage upper limit of the sine-wave generator being used.
g. Move the cable from the CH 2 OR $Y$ input connector to the CH 1 OR $X$ input connector. Set the Vertical MODE switch to CH 1.
h. Repeat parts $c$ through e for all indicated CH 1 VOLTS/DIV switch settings, up to the output-voltage upper limit of the sine-wave generator being used.

## 3. Check Channel Isolation

a. Set:

| CH 1 VOLTS/DIV | 1 V |
| :--- | :--- |
| CH 2 VOLTS/DIV | 0.5 V |
| Channel 2 AC-GND-DC | GND |
| SEC/DIV | 0.05 ms |

b. Set the generator to produce a $20-\mathrm{MHz}$, 5-division display.
c. Set CH 1 VOLTS/DIV switch to 0.5 V for a 10-division display.
d. Set Vertical MODE switch to CH 2 and ALT.
e. CHECK-The display amplitude is less than 0.1 division.
f. Move the test-signal cable from the CH 1 OR $X$ input connector to the CH 2 OR $Y$ input connector.
g. Set:

| Vertical MODE | CH 1 |
| :--- | :--- |
| Channel 1 AC-GND-DC | GND |
| Channel 2 AC-GND-DC | DC |

h. CHECK-The display amplitude is less than 0.1 division.
i. Disconnect the test equipment from the instrument.

## 4. Check Common Mode-Rejection Ratio

a. Set:

| VOLTS/DIV (both) | 10 mV |
| :--- | :--- |
| Channel 1 AC-GND-DC (both) | DC |
| Vertical MODE | BOTH, |
|  | NORM, |
|  | and ALT |

b. Connect the leveled sine-wave generator output via a $50-\Omega$ coaxial cable, a $50-\Omega$ termination, and dual-input coupler to the CH1 OR X and CH 2 OR $Y$ input connectors.
c. Set the generator to produce a $10-\mathrm{MHz}$, 6-division display.
d. Set Vertical MODE switch to CH 2 INVERT and ADD.
e. CHECK-Display amplitude is 0.6 division or less.
f. Disconnect the test equipment from the instrument.

## PROCEDURE STEPS

## 1. Check Timing Accuracy and Linearity

a. Connect $50-\mathrm{ns}$ time markers from the timemark generator via a $50-\Omega$ coaxial cable and a $50-\Omega$ termination to the CH 1 OR X input connector.
b. Adjust the Trigger LEVEL control for a stable, triggered display.
c. Use the Horizontal POSITION control to align the second time marker with the second vertical graticule line.
d. CHECK-Timing accuracy is within 3\% (0.24 division at the tenth vertical graticule line), and linearity is within $5 \%$ ( 0.10 division over any 2 of the center 8 divisions).

#### Abstract

NOTE For checking the timing accuracy of the SEC/ DIV switch settings from 50 ms to 0.5 s , watch the time marker tips only at the second and tenth vertical graticule lines while adjusting the Horizontal POSITION controls to line up the time markers.

e. Repeat parts $b$ through $d$ for the remaining SEC/DIV and time-mark generator setting combinations shown in Table 4-3 under "X1 Normal" column.
f. Set:

| SEC/DIV | $0.1 \mu \mathrm{~s}$ |
| :--- | :--- |
| Horizontal MAG | $\times 10$ |

g. Select 20 -ns time markers from the timemark generator.

## note

The 20-ns time-markers tips are rounded off and cannot be used as measurement reference points. Use the rising edge of the time markers as measurement reference points. Vertically adjust the $50 \%$ point of the time markers on the center horizontal graticule line.
h. Use the Horizontal POSITION controls to align the first time marker that is 50 ns beyond the start of the sweep with the second vertical graticule line.
i. CHECK-Timing accuracy is within $4 \%$ ( 0.32 division at the tenth vertical graticule line), and linearity is within $7 \%$ ( 0.14 division over any 2 of the center 8 divisions). Exclude any portion of the sweep past the 50th magnified division.
j. Repeat parts $h$ and $i$ for the remaining SEC/DIV and time-mark generator setting combinations shown in Table 4-3 under the " $\times 10$ Magnified" column.

Table 4-3
Settings for Timing Accuracy Checks

| SEC/DIV <br> Switch <br> Setting | Time-Mark Generator Setting |  |
| :---: | :---: | :---: |
|  | X10 Magnified |  |
| $0.1 \mu \mathrm{~s}$ | $0.1 \mu \mathrm{~s}$ | 20 ns |
| $0.2 \mu \mathrm{~s}$ | $0.2 \mu \mathrm{~s}$ | 20 ns |
| $0.5 \mu \mathrm{~s}$ | $0.5 \mu \mathrm{~s}$ | 50 ns |
| $1 \mu \mathrm{~s}$ | $1 \mu \mathrm{~s}$ | $0.1 \mu \mathrm{~s}$ |
| $2 \mu \mathrm{~s}$ | $2 \mu \mathrm{~s}$ | $0.2 \mu \mathrm{~s}$ |
| 5 s | $5 \mu \mathrm{~s}$ | $0.5 \mu \mathrm{~s}$ |
| $10 \mu \mathrm{~s}$ | $10 \mu \mathrm{~s}$ | $1 \mu \mathrm{~s}$ |
| $20 \mu \mathrm{~s}$ | $20 \mu \mathrm{~s}$ | $2 \mu \mathrm{~s}$ |
| $50 \mu \mathrm{~s}$ | $50 \mu \mathrm{~s}$ | $5 \mu \mathrm{~s}$ |
| 0.1 ms | 0.1 ms | $10 \mu \mathrm{~s}$ |
| 0.2 ms | 0.2 ms | $20 \mu \mathrm{~s}$ |
| 0.5 ms | 0.5 ms | $50 \mu \mathrm{~s}$ |
| 1 ms | 1 ms | 0.1 ms |
| 2 ms | 2 ms | 0.2 ms |
| 5 ms | 5 ms | 0.5 ms |
| 10 ms | 10 ms | 1 ms |
| 20 ms | 20 ms | 2 ms |
| 50 ms | 50 ms | 5 ms |
| 0.1 s | 0.1 s | 10 ms |
| 0.2 s | 0.2 s | 20 ms |
| 0.5 s | 0.5 s | 50 ms |

## 2. Check POSITION Range

a. Set:

SEC DIV Horizontal MAG
0.1 ms $\times 1$
b. Select 0.1 ms time markers from the timemark generator.
c. CHECK-The start of the sweep can be positioned to the right of the center vertical graticule line by rotating the Horizontal POSITION control fully clockwise.
d. CHECK-The tenth time marker can be positioned to the left of the center vertical graticule line by rotating the Horizontal POSITION control fully counterclockwise.
e. Select 0.5 ms time markers from the timemark generator.
f. Align the 3rd time marker with the center vertical graticule line using the Horizontal POSITION control.
g. Set the Horizontal MAG switch to X10.
h. CHECK-Magnified time marker can be positioned to the left of the center vertical graticule line by rotating the Horizontal POSITION control fully counterclockwise.
i. CHECK-Start of the sweep can be positioned to the right of the center vertical graticule line by rotating the Horizontal POSITION control fully clockwise.

## 3. Check Variable Range

a. Set the Horizontal MAG switch to $\mathrm{X1}$ and center the display.
b. Set the SEC/DIV Variable control fully counterclockwise.
c. CHECK-The spacing between time markers is 2 divisions or less.
d. Return the SEC/DIV Variable knob to the CAL detent position.
e. Disconnect the test equipment from the instrument.
4. Check $X$ Gain
a. Set:

b. Connect a $50-\mathrm{mV}$, standard-amplitude signal from the calibration generator via a $50-\Omega$ coaxial cable to the CH 1 OR X input connector.
c. CHECK-The display is between 4.85 and 5.15 divisions.
d. Disconnect the test equipment from the instrument.
5. Check $\times$ Bandwidth
a. Set both channels VOLTS/DIV switches to 50 mV .
b. Connect the leveled sine-wave generator output via a $50-\Omega$ coaxial cable and a $50-\Omega$ termination to the CH 1 OR X input connector.
c. Set the generator to produce an 8-division horizontal display at an output frequency of 50 kHz .
d. Increase the output frequency until the $X$-Axis (horizontal) deflection amplitude is 5.7 divisions.
e. CHECK-The frequency is 2 MHz or greater.
f. Disconnect the test equipment from the instrument.

## PROCEDURE STEPS

## 1. Check Internal Triggering

a. Connect the leveled sine-wave generator output via a $50-\Omega$ coaxial cable and a $50-\Omega$ termination to the $C H 1$ OR $X$ input connector.
b. Set the generator to produce a 3-division display at an output frequency of 5 MHz .
c. Set channel 1 VOLTS/DIV switch to 1 V .
d. CHECK-Stable display can be obtained by adjusting the Trigger LEVEL control for each switch
combination given in Table 4-4. Ensure that the TRIG'D light comes on when triggered.

Table 4-4
Switch Combinations for Triggering Checks

| Trigger MODE | Trigger SLOPE |
| :---: | :---: |
| NORM | Positive $\_$ |
| NORM | Negative $\neg$ |
| P-P AUTO | Negative $\neg$ |
| P-P AUTO | Positive $\quad\ulcorner$ |

e. Move the test-signal cable from the CH 1 OR $X$ input connector to the $C H 2$ OR $Y$ input connector. Set the Vertical MODE switch to CH 2.
f. Repeat part d.
g. Set:

| SEC/DIV | 0.01 ms |
| :--- | :--- |
| Horizontal MAG | $\times 10$ |

h. Set the generator output to produce a $30-\mathrm{MHz}, 1$-division display.
i. Repeat part d.
j. Move the test-signal cable from the $\mathrm{CH} 2 \mathrm{OR} Y$ input connector to the CH 1 OR $X$ input connector. Set the Vertical MODE switch to CH 1.
k. Repeat part d.

1. Disconnect the test equipment from the instrument.

## 2. Check External Triggering

a. Set:
CH 1 VOLTS/DIV
SEC/DIV
Horizontal MODE
Trigger MODE
Trigger SOURCE
d. Set:

| Trigger MODE | NORM |
| :--- | :--- |
| Trigger SOURCE | EXT, EXT |

e. CHECK-Display is triggered along the entire positive slope of the waveform as the Trigger LEVEL control is rotated.
f. CHECK-Display is not triggered at either extreme of rotation of the Trigger LEVEL control.
g. Set the Trigger SLOPE switch to negative (乙).
h. CHECK-Display is triggered along the entire negative slope of the waveform as the Trigger LEVEL control is rotated.
i. CHECK-Display is not triggered at either extreme of rotation of the Trigger LEVEL control.
j. Disconnect the test equipment from the instrument.

## 4. Check Single Sweep Operation

a. Set:

| CH 1 VOLTS/DIV | 10 mV |
| :--- | :--- |
| SEC/DIV | 0.5 ms |
| Trigger SOURCE | CH 1 |
| Trigger SLOPE | Positive |
|  | $(\square)$ |

b. Connect $50-\mathrm{mV}$, standard-amplitude signal from the calibration generator via a $50-\Omega$ coaxial cable to the CH 1 OR X input connector.
c. Adjust the Trigger LEVEL control to obtain a stable display.
d. Set:

| Channel 1 AC-GND-DC | GND |
| :--- | :--- |
| Trigger MODE | SGL SWP |

e. Press the SGL SWP RESET button. The TRIG'D/READY LED illuminates and remains on.
f. Set the Channel 1 AC-GND-DC switch to DC.
NOTE

The INTENSITY control may require adjustment to observe the single-sweep trace.
g. CHECK-TRIG'D/READY LED goes out and a single sweep occurs.
h. Press the SGL SWP RESET button several times.
i. CHECK-A single-sweep trace occurs, and the TRIG'D/READY LED illuminates briefly every time the SGL SWP RESET button is pressed.
j. Disconnect the test equipment from the instrument.

## EXTERNAL Z-AXIS AND PROBE ADJUST

Equipment Required (See Table 4-1):<br>Calibration Generator (Item 2) $50-\Omega$ Termination (Item 8)<br>Two 50- $\Omega$ Coaxial Cable (Item 6)<br>Dual-Input Coupler (Item 7)

## PROCEDURE STEPS

## 1. Check External Z-Axis Operation

a. Connect a $5-\mathrm{V}$ standard-amplitude signal from the calibration generator via dual-input coupler to the CH 1 OR $X$ and EXT INPUT OR $Z$ connectors.

NOTE
The INTENSITY level may need adjustment to view the intensity modulation on the displayed waveform.
b. CHECK-For noticeable intensity modulation. The positive part of the sine wave should be of lower intensity than the negative part.
c. Disconnect the test equipment from the instrument.

## 2. Check Probe Adjust Operation

a. Set:

| CH 1 VOLTS/DIV | 10 mV |
| :--- | :--- |
| SEC/DIV | 0.5 ms |
| Trigger SOURCE | CH 1 |

b. Connect the $10 \times$ Probe to the $\mathrm{CH} 1 \mathrm{OR} X$ input connector and clip the probe tip to the PROBE connector on the instrument front panel. If necessary, adjust the probe compensation for a flat-topped square-wave display.
c. CHECK-Display amplitude is 4.75 to 5.25 divisions.
d. Disconnect the probe from the instrument.

# ADJUSTMENT PROCEDURE 

## INTRODUCTION

## PURPOSE

The Adjustment Procedure is used to return the instrument to conformance with the Performance Requirement statements listed in Table 1-1. Adjustments contained in this procedure should only be performed after checks from the Performance Check Procedure (Section 4) have indicated a need for readjustment or after repairs have been made to the instrument.

## STRUCTURE

This procedure is structured into subsections, each of which can be performed independently to permit adjustment of individual sections of the instrument. For example, if only the Vertical section fails to meet the Performance Requirements or has been repaired, it can be readjusted with little or no effect on other sections of the instrument.

The Power Supply section, however, affects all other sections of the instrument. Therefore, if repairs or readjustments have been made that change the absolute value of any of the supply voltages, the entire Adjustment Procedure should be performed.

At the beginning of each subsection is a list of all the front-panel control settings required to prepare the instrument for performing Step 1 in that subsection. Each succeeding step within a subsection should be performed in sequence and in its entirety to ensure that control settings will be correct for ensuing steps. All steps within a subsection should be completed.

## TEST EQUIPMENT REQUIRED

Table $4-1$ is a complete list of the test equipment required to accomplish both the Performance Check Procedure in Section 4 and the Adjustment Procedure in this section. To assure accurate measurements, it is important that test equipment used for making these checks meet or exceed the specifications described in Table 4-1. When considering
use of equipment other than that recommended, utilize the Minimum Specification column to determine whether available test equipment will suffice.

Detailed operating instructions for test equipment are not given in this procedure. If more operating information is required, refer to the appropriate test equipment instruction manual.

## LIMITS AND TOLERANCES

The limits and tolerances stated in this procedure are instrument specifications only if they are listed in the Performance Requirements column of Table1-1. Tolerances given are applicable only to the instrument undergoing adjustment and do not include test equipment error. Adjustment of the instrument must be accomplished at an ambient temperature between $+20^{\circ} \mathrm{C}$ and $+30^{\circ} \mathrm{C}$, and the instrument must have had a warm-up period of at least 20 minutes.

## ADJUSTMENTS AFFECTED BY REPAIRS

Repairs to a circuit may affect one or more adjustment settings of the instrument. Table 5-1 identifies the adjustment(s) affected due to repairs or replacement of components on a circuit board. Refer to Table 5-1 if a partial procedure is performed or if a circuit requires readjustment due to repairs to a circuit. To use Table 5-1, first find, in the leftmost column, the circuit that was repaired. Then move to the right, across that row, until you come to a darkened square, move up the column and check the accuracy of the adjustment found at the heading of that column. Readjust if necessary.

## PREPARATION FOR ADJUSTMENT

The instrument cabinet must be removed to perform the Adjustment Procedure. See the Cabinet remove and replace instructions located in the Maintenance section of the manual.

All test equipment items listed in Table 4-1 in the Performance Check Procedure section are required to accomplish a complete Adjustment Procedure. At the beginning of each subsection there is an equipment-required list showing only the test equipment necessary for performing the steps in that subsection. In this list, the item number following each piece of equipment corresponds to the item number listed in Table 4-1.

Before performing this procedure, do not preset any internal adjustments and do not change the -8.6 V power-supply adjustment. Altering this adjustment may necessitate a complete
readjustment of the instrument, whereas only a partial adjustment might otherwise be required. Only change an internal adjustment setting if a Performance Characteristic cannot be met with the original setting.

Before performing any procedure in this section, set the POWER switch to ON and allow a 20-minute warm-up period.

The most accurate display adjustments are made with a stable, well-focused, low-intensity display. Unless otherwise noted, adjust the INTENSITY, FOCUS, and Trigger LEVEL controls as needed to view the display.

## PROCEDURE STEPS

1. Check/Adjust Power Supply DC Levels (R916)

## NOTE

Review the information at the beginning of the Adjustment Procedure before starting this step.
a. Connect the digital voltmeter low lead to chassis ground and connect the volts lead to the $-8.6 V_{1}$ supply (W989).
b. CHECK-Voltmeter reading is -8.5 V to -8.7 V . If the reading is within these limits, skip to part d.
c. ADJUST-The -8.6 $\mathrm{V}_{1}$ Adj potentiometer (R916) for a voltmeter reading of -8.6 V .
d. CHECK-Voltage levels of the remaining power supplies listed in Table 5-2 are within the specified limits.
e. Disconnect the test equipment from the instrument.

Table 5-2
Power Supply Limits

| Power <br> Supply | Test <br> Point | Reading <br> (Volts) |
| :---: | :---: | :---: |
| $-8.6 \mathrm{~V}_{1}$ | $W 989$ | -8.56 to -8.64 |
| $+5.0 \mathrm{~V}_{1}$ | W 991 | +4.85 to +5.15 |
| $+8.6 \mathrm{~V}_{1}$ | $W 987$ | +8.34 to +8.86 |
| +102.0 V | $W 984$ | +98.9 to +105.0 |
| +205.0 V | $W 985$ | +198.8 to +211.1 |
| +22 V unreg | $W 752$ | Approx. +24 V |

## 2. Adjust CRT Grid Bias (R851)

a. Adjust the front-panel FOCUS control to produce a well-defined dot.
b. Rotate the INTENSITY control fully counterclockwise.
c. ADJUST-Grid Bias (R851) for a visible dot, then back off the Grid Bias potentiometer until the dot just disappears.

## 3. Adjust Astigmatism (R870)

a. Set:

| Vertical MODE | CH 1 |
| :--- | :--- |
| Channel 1 AC-GND-DC | DC |
| SEC/DIV | $5 \mu \mathrm{~S}$ |
| Trigger Source | CH 1 |

b. Connect the leveled sine-wave generator output via a $50-\Omega$ coaxial cable and a $50-\Omega$ termination to the CH 1 OR $X$ input connector.
c. Set the generator to produce a $50-\mathrm{kHz}, 4-$ division display.
d. ADJUST-Astig (R870) and the front-panel FOCUS control for the best defined waveform.
e. Disconnect the test equipment from the instrument.

## 4. Adjust Trace Alignment

a. Position the trace to the center horizontal graticule line.
b. ADJUST-Front-panel TRACE ROTATION control for optimum alignment of the trace with the center horizontal graticule line.

## 5. Adjust Geometry (R871)

a. Set:
CH 1 VOLTS/DIV
50 mV
SEC/DIV
0.1 ms
b. Connect $50-\mathrm{ms}$ time markers from the timemark generator via a 50- $\Omega$ coaxial cable and a $50-\Omega$ termination to the $\mathrm{CH} 1 \mathrm{OR} X$ input connector.
c. Position the baseline part of the display below the bottom horizontal graticule line using the CH 1 POSITION control .
d. Adjust the SEC/DIV Variable control for five markers per division.
e. ADJUST-Geom (R871) for minimum curvature of the time markers at the left and right edges of the graticule.
f. Set Channel 1 AC-GND-DC switch to GND.
g. ADJUST-Geom (R871) for minimum curvature of the baseline trace when positioned at the top and bottom horizontal graticule lines using the CH 1 POSITION control.
h. Set the Channel 1 AC-GND-DC switch to $D C$.
i. Repeat parts e through $h$ for optimum compromise between the vertical and horizontal displays.
j. Disconnect the test equipment from the instrument.

## VERTICAL

```
Equipment Required (See Table 4-1):
    Calibration Generator (Item 1)
    Leveled Sine-Wave Generator (Item 2)

## PROCEDURE STEPS

## 1. Adjust Channel 1 Variable Balance (R33)

a. Rotate the CH 1 VOLTS/DIV Variable control fully counterclockwise.
b. Position the trace on the center horizontal graticule line using the CH 1 POSITION control.
c. Rotate the CH 1 VOLTS/DIV Variable control clockwise to the CAL detent.
d. ADJUST-CH 1 Var Bal (R33) to set the trace to the center horizontal graticule line.
e. Repeat parts a through d until there is no trace shift between the fully clockwise and the fully counterclockwise positions of the CH 1 VOLTS/DIV Variable control.
f. Return the CH 1 VOLTS/DIV Variable control to the CAL detent.

## 2. Adjust Channel 2 Variable Balance (R83)

a. Set Vertical MODE switch to CH 2.
b. Rotate the CH 2 VOLTS/DIV Variable control fully counterclockwise.
c. Position the trace on the center horizontal graticule line using the CH 2 POSITION control.
d. Rotate the CH 2 VOLTS/DIV Variable control clockwise to the CAL detent.
e. ADJUST-CH 2 Var Bal (R83) to set the trace to the center horizontal graticule line.
f. Repeat parts a through d until there is no trace shift between the fully clockwise and the fully counterclockwise positions of the CH 1 VOLTS/DIV Variable control.
g. Return the CH 1 VOLTS/DIV Variable control to the CAL detent

## 3. Adjust Channel 2 Invert Balance (R84)

a. Position the trace on the center horizontal graticule line using the Channel 2 POSITION control.
b. Set Vertical MODE switch to CH 2 INVERT.
c. ADJUST-CH 2 Invert Bal (R84) to set the trace to the center horizontal graticule line.
d. Set Vertical MODE switch to NORM.
e. Repeat parts a through d until there is no trace shift when switching from NORM to CH 2 INVERT.

## 4. Adjust Vertical Gain (R145 and R195)

a. Set:

Vertical MODE
CH 1, NORM
CH 1 VOLTS/DIV Variable AC-GND-DC (both)
Trigger SOURCE
b. Connect a $20-\mathrm{mV}$, standard-amplitude signal from the calibration generator via a $50-\Omega$ coaxial cable to the CH 1 OR X input connector.
c. Center the display within the graticule using the CH 1 POSITION control.
d. ADJUST-CH 1 Gain (R145) for an exact 4division display.
e. Move the test-signal cable from the CH 1 OR X input connector to the CH 2 OR $Y$ input connector.
f. Set the Vertical MODE switch to CH 2.
g. Center the display within the graticule using the CH 2 POSITION control.
h. ADJUST-CH 2 Gain (R195) for an exact 4division display.
i. Repeat parts $b$ through $h$ until the gain of the two channels is identical.

## 5. Check Deflection Accuracy and VOLTS/DIV Variable Range

a. CHECK—Deflection accuracy is within the limits given in Table 5-3 for each CH 1 VOLTS/DIV switch setting and corresponding standard-amplitude signal. When at the $20-\mathrm{mV}$ VOLTS/DIV switch setting,
rotate the CH 1 VOLTS/DIV Variable control fully counterclockwise and CHECK that the display decreases to two divisions or less. Then return the CH 1 VOLTS/DIV Variable control to the CAL detent and continue with the $50-\mathrm{mV}$ check.
b. Move the cable from the $\mathrm{CH} 1 \mathrm{OR} X$ input connector to the CH 2 OR $Y$ input connector. Set the Vertical MODE switch to CH 2.
c. Repeat part busing the Channel 2 controls.

Table 5-3
Deflection Accuracy Limits

| VOLTS/DIV <br> Switch <br> Setting | STANDARD <br> Amplitude <br> Signal | ACCURACY <br> Limits <br> (Divisions) |
| :---: | :---: | :---: |
| 5 mV | 20 mV | 3.88 to 4.12 |
| 10 mV | 50 mV | 4.85 to 5.15 |
| 20 mV | 0.1 V | 4.85 to 5.15 |
| 50 mV | 0.2 V | 3.88 to 4.12 |
| 0.1 V | 0.5 V | 4.85 to 5.15 |
| 0.2 V | 1 V | 4.85 to 5.15 |
| 0.5 V | 2 V | 3.88 to 4.12 |
| 1 V | 5 V | 4.85 to 5.15 |
| 2 V | 10 V | 4.85 to 5.15 |
| 5 V | 20 V | 3.88 to 4.12 |

## 6. Check Input Coupling

a. Set the AC-GND-DC switches (both channels) to GND.
b. Position the trace on the center horizontal graticule line using the CH 2 POSITION control.
c. Change the generator output to 50 mV .
d. Set the Channel $2 A C-G N D-D C$ switch to $A C$.
e. CHECK-The display is centered about the center horizontal graticule line.
f. Set the Channel 2 AC-GND-DC switch to DC.
g. CHECK-The display is ground referenced on the center horizontal graticule line.
h. Move the test-signal cable from the CH 2 OR Y input connector to the CH 1 OR X input connector.
i. Set the Vertical MODE switch to CH 1.
j. Repeat parts b through g using the Channel 1 controls.

## 7. Check Position Range

a. Set:

| VOLTS/DIV (both) | 10 mV |
| :--- | :--- |
| AC-GND-DC (both) | AC |
| SEC/DIV | 0.2 ms |
| Trigger COUPLING | AC |

b. Set the calibration generator for 0.1 V .
c. Adjust the CH 1 VOLTS/DIV Variable control to produce a 5.25 -division display.
d. Set the CH 1 VOLTS/DIV to 5 mV .
$e$. Set the calibration generator to produce a 0.2 V signal.
f. CHECK-The bottom and top of the trace may be positioned above and below the center horizontal graticule line by rotating the CH 1 POSITION control fully clockwise and counterclockwise respectively.
g. Move the cable from the CH 1 OR $X$ input connector to the CH 2 OR $Y$ input connector.
h. Set the Vertical MODE switch to CH 2.
i. Repeat parts b through f using the Channel 2 controls.
j. Disconnect the test equipment from the instrument.

## 8. Adjust Attenuator Compensation

a. Set:

| VOLTS/DIV (both) | 10 mV |
| :--- | :--- |
| AC-GND-DC (both) | DC |

b. Connect the high-amplitude, square-wave output from the calibration generator via a $50-\Omega$ termination, a miniature probe tip to BNC adapter, and the 10 X probe to the CH 2 OR Y input connector.
c. Set the generator to produce a $1-\mathrm{kHz}, 5-$ division display and compensate the probe using the probe compensation adjustment (see the probe instruction manual).
d. Replace the probe and miniature probe tip to BNC adapter with a $50-\Omega$ coaxial cable and $50-\Omega$ termination.
e. Set the generator to produce a 5-division display.
f. ADJUST-Trimmer " 1 " for flattest response on the square wave signal. See Figure 5-1 for location of the trimmers.

Figure 5-1. Attenuator trimmer adjustments.
g. Replace the $50-\Omega$ coaxial cable and $50-\Omega$ termination with the probe and miniature probe tip to BNC adapter.
h. Set the generator to produce a 5-division square wave.
i. ADJUST-Trimmer " 1 N " for flattest response on square wave.
j. Set the CH 2 VOLTS/DIV switch to 20 mV .
k. Repeat parts $d$ through $i$ except adjust the " 2 " and " 2 N " trimmers in parts f and i respectively.
I. Set the CH 2 VOLTS/DIV switch to 50 mV .
m . Repeat parts d through i except adjust the " 3 " and " $3 N$ " trimmers in parts $f$ and $i$ respectively.
n. Set the $\mathrm{CH} 2 \mathrm{VOLTS} / \mathrm{DIV}$ switch to 0.5 V .
o. Repeat parts $d$ through $i$ except adjust the " 4 " and " 4 N " trimmers in parts $f$ and $i$ respectively.
p. Set the Vertical MODE switch to CH 1.
q. Repeat parts $b$ through $p$ for the Channel 1 Attenuators.
r. Disconnect the test equipment from the instrument.

## 9. Check Vertical ALT Operation

a. Set:

| AC-GND-DC (both) | GND |
| :--- | :--- |
| Vertical MODE | BOTH, NORM, |
|  | and ALT |
| SEC/DIV | 0.1 s |
| Trigger SOURCE | CH 1 |

b. Position the Channel 1 and Channel 2 traces about two divisions apart using the CH 1 and CH 2 POSITION controls.
c. CHECK-Channel 1 and Channel 2 traces move across the screen alternately.
d. Set Vertical switch to CHOP.
e. CHECK-Channel 1 and Channel 2 traces move across the screen at the same time.
10. Adjust CHOP Switch Balance (R140)
a. Set:

SEC/DIV
Trigger MODE
Trigger SOURCE

1 ms
NORM
VERT MODE
b. Connect the 10X probe to the rear of R242 on top of the A1-Main circuit board and adjust test oscilloscope for a 4-division display.
c. ADJUST-Chop-Sw Bal (R140) for no triggering on chop segments when rotating the Trigger LEVEL control.
11. Check ADD MODE Operation
a. Set:

| VOLTS/DIV (both) | 20 mV |
| :--- | :--- |
| AC-GND-DC (both) | DC |
| Vertical MODE | BOTH, NORM, |
| SEC/DIV | and ALT |
| Horizontal MODE | 0.5 ms |
| Trigger SOURCE | X1 |
|  | CH 1 |

b. Position both traces on the center horizontal graticule line using the CH 1 and CH 2 POSITION controls.
c. Set the calibration generator to produce a $50-\mathrm{mV}$ signal.
d. Connect the output of the calibration generator to both the CH 1 OR X input and the CH 2 OR Y input with dual-input coupler.
e. Check that both channels show a 2.5 -division display.
f. Set: Vertical MODE switch to ADD.
g. CHECK-The resultant display is five divisions $3 \%$ ( 4.85 to 5.15 divisions).
h. Disconnect the test equipment from the instrument.

## 12. Adjust High-Frequency Compensation

 (C241, C242, C243, and R241)a. Set:

| VOLTS/DIV (both) | 10 mV |
| :--- | :--- |
| Vertical MODE | CH 1 |
| SEC/DIV | 0.2 ms |

b. Cohnect the positive-going, fast-rise, squarewave output from the calibration generator via a $50-\Omega$ coaxial cable, a 10 X attenuator, and a $50-\Omega$ termination to the CH 1 OR X input connector.
c. Set the generator to produce a $1-\mathrm{MHz}, 5-$ division display.
d. Set the top of the display to the center horizontal graticule line using the CH 1 POSITION control.
e. ADJUST-HF Comp (C242 and C243) for the $5 \%$ or less overshoot ( 0.3 division) on the displayed signal.
f. ADJUST-HF Comp (C241 and R241) for best flat top on the front corner.
g. Repeat parts e and funtil on further improvement is noted.
h. Set the CH 1 VOLTS/DIV switch to 5 mV .
i. Set the generator to produce a 5-division display.
j. Check for aberrations of 5\% (0.3 division) or less.
k. Repeat part j for each CH 1 VOLTS/DIV switch settings from 5 mV through 0.5 V . Adjust the generator output and add or remove the 10X attenuator as necessary to maintain a 5-division display at each VOLTS/DIV switch setting.
I. Move the cable from the CH 1 OR $X$ input connector to the CH 2 OR $Y$ input connector. Set the Vertical MODE switch to CH 2.
m. Repeat part $k$ for Channel 2.
n. Disconnect the test equipment from the instrument.

## NOTE

Install the instrument cabinet for the remaining vertical checks and allow a 20-minute warm-up period before continuing with the "Adjustment Procedure". See the "Cabinet" remove and replace instructions located in the "Maintenance" section of the manual.
13. Check Bandwidth
a. Set:

VOLTS/DIV (both)
5 mV
Vertical MODE
CH 1
SEC/DIV
Trigger SOURCE
10 ms
VERT MODE
b. Connect the leveled sine-wave generator output via a $50-\Omega$ coaxial cable and a $50-\Omega$ termination to the CH 1 OR X input connector.
c. Set the generator to produce a $50-\mathrm{kHz}, 6-$ division display.
d. Increase the sine-wave frequency until a 4.2-division display is obtained.
e. CHECK-the frequency is greater than 20 MHz .
f. Repeat parts $c$ through e for all CH 1 VOLTS/ DIV switch settings, up to the output-voltage upper limit of the sine-wave generator being used.
g. Move the cable from the $\mathrm{CH} 1 \mathrm{OR} X$ input connector to the CH 2 OR Y input connector. Set the Vertical MODE switch to CH 2.
h. Repeat parts c through e for all CH 2 VOLTS/ DIV switch settings, up to the output-voltage upper limit of the sine-wave generator being used.

## 14. Check Channel Isolation

a. Set:

| CH 1 VOLTS/DIV | 0.5 V |
| :--- | :--- |
| CH 2 VOLTS/DIV | 1 V |
| Channel 1 AC-GND-DC | GND |
| SEC/DIV | 0.05 ms |

b. Set the generator to produce a $20-\mathrm{MHz}$, 5-division display.
c. Set CH 2 VOLTS/DIV switch to 0.5 V for a 10-division display.
d. Set Vertical MODE switch to CH 1 and ALT.
e. CHECK-The display amplitude is less than 0.1 division.
f. Move the test-signal cable from the CH 2 OR $Y$ input connector to the CH 1 OR X input connector.
g. Set:

Vertical MODE $\quad \mathrm{CH} 2$
Channel 1 AC-GND-DC DC
Channel 2 AC-GND-DC GND
h. CHECK-The display amplitude is less than 0.1 division.
i. Disconnect the test equipment from the instrument:
15. Check Common-Mode Rejection Ratio
a. Set:

VOLTS/DIV (both) 10 mV
Channel 2 AC-GND-DC DC
Vertical MODE

BOTH, NORM,
and ALT
b. Connect the leveled sine-wave generator output via a $50-\Omega$ coaxial cable, a $50-\Omega$ termination, and a dual-input coupler to the $\mathrm{CH} 1 O R X$ and CH 2 or $Y$ input connectors.
c. Set the generator to produce a $10-\mathrm{MHz}$, 6 -division display.
d. Set Vertical MODE switch to CH 2 INV and ADD.
e. CHECK-Display amplitude is 0.6 division or less.
f. Disconnect the test equipment from the instrument.

NOTE<br>To continue with the "Adjustment Procedure", remove the instrument cabinet and allow a 20 -minute warm-up period. See the "Cabinet" removal instructions located in the "Maintenance" section of the manual.

## HORIZONTAL

## PROCEDURE STEPS

1. Adjust 1 -ms Timing (R744)
a. Connect $1-\mathrm{ms}$ time markers from the timemark generator via a 50- $\Omega$ coaxial cable and a $50-\Omega$ termination to the CH 1 OR X input connector.
b. Align the first time marker with the first (extreme left) vertical graticule line using the Horizontal POSITION control.

NOTE
When making timing measurements, use the tips of the time markers positioned at the center horizontal graticule line as the measurement reference points.
c. ADJUST-X1 Gain (R744) for one marker per division over the center eight divisions.

## 2. Adjust Magnifier Gain (R777)

a. Set the MAG switch to X 10 .
b. Select $100 \mu \mathrm{~s}$ time markers from the timemark generator.
c. Align the first time marker with the first (extreme left) vertical graticule line using the Horizontal POSITION control.
d. ADJUST-X10 Mag Gain (R777) for 1 time marker per division.
3. Adjust Magnifier Registration (R782)
a. Set the SEC/DIV switch to 0.2 ms .
b. Select 1 ms time markers from the time-mark generator.
c. Position the middle time marker to the center vertical graticule line using the Horizontal POSITION control.
d. Set the MAG switch from $\times 10$ to $\times 1$ position.
e. ADJUST-Mag Reg (R782) to position the middle time marker to the center vertical graticule line.
f. Set the MAG switch from $\times 1$ to $\times 10$ position and CHECK for no horizontal shift in the time marker.
g. Repeat parts $c$ through $f$ until no further improvement is noted.

## 4. Check Position Range

a. Set:

| SEC/DIV | 0.1 ms |
| :--- | :--- |
| Horizontal MAG | $\times 1$ |

b. Select 0.1 ms time markers from the timemark generator.
c. CHECK-The start of the sweep can be positioned to the right of the center vertical graticule line by rotating the Horizontal POSITION control fully clockwise.
d. CHECK-The tenth time marker can be positioned to the left of the center vertical graticule line by rotating the Horizontal POSITION control fully counterclockwise.
e. Select 0.5 ms time markers from the timemark generator.
f. Align the 3rd time marker with the center vertical graticule line using the Horizontal POSITION control.
g. Set the Horizontal MAG switch to X10.
h. Check-Magnified time marker can be positioned to the left of the center vertical graticule line by rotating the Horizontal POSITION control fully counterclockwise.
i. Check-The tenth time marker can be positioned to the right of the center vertical graticule by rotating the Horizontal POSITION control fully clockwise.

## 5. Check Variable Range

a. Set Horizontal MAG switch to X 1 and center the display.
b. Set the SEC/DIV Variable control knob fully counterclockwise.
c. CHECK-The spacing between time markers is 2 divisions or less.
d. Return the SEC/DIV Variable knob to the CAL detent position.
6. Adjust 0.1 -ms and $0.1-\mu \mathrm{s}$ Timing (R722 and C703)
a. Set the SEC/DIV switch to 0.1 ms .
b. Select $0.1-\mathrm{ms}$ time markers from the timemark generator.
c. ADJUST-0.1-ms Timing (R722) for 1 marker per division.
d. Set the SEC/DIV switch to $0.1 \mu \mathrm{~s}$.
e. Select $0.1-\mu \mathrm{s}$ time markers from the timemark generator.
f. ADJUST-0.1- $\mu \mathrm{S}$ Timing (C703) for 1 marker per division.

## 7. Adjust High-Speed Timing (C783, C794)

a. Set:

$$
\begin{array}{ll}
\text { Channel } 1 \text { AC-GND-DC } & \text { AC } \\
\text { Horizontal MAG } & \times 10
\end{array}
$$

b. Select $20-\mathrm{ns}$ time markers from the timemark generator and set the display for maximum amplitude within the graticule area.
c. Adjust the Trigger LEVEL control for a stable triggered display.
d. ADJUST-HS Timing (C783 and C794) for two divisions between each time marker.

## NOTE

The 20-ns time-markers tips are rounded off and cannot be used as measurement reference points. Use the rising edge of the time markers as measurement reference points to adjust the high-speed timing capacitors. Vertically adjust the $50 \%$ point of the time markers on the center horizontal graticule line.
8. Check Timing Accuracy and Linearity
a. Set:
CH VOLTS/DIV
Horizontal MAG

### 0.5 V

$\times 1$
b. Select $0.1-\mu \mathrm{s}$ time markers from the timemark generator.
c. Adjust the Trigger LEVEL control for a stable, triggered display.
d. Use the Horizontal POSITION control to align the second time marker with the second vertical graticule line.
e. CHECK-Timing accuracy is within $3 \%$ ( 0.24 division at the tenth vertical graticule line), and linearity is within 5\% ( 0.10 division over any two of the center eight divisions).

## note

When checking the timing accuracy for SEC/ DIV switch settings from 50 ms to 0.5 s , watch the time marker tips only at the second and tenth vertical graticule lines while adjusting the Horizontal POSITION control.
f. Repeat parts $c$ through e for the remaining SEC/DIV and time-mark-generator setting combinations shown in Table 5-4 under the "X1 Normal" column.

## g. Set:

| SEC/DIV | $0.1 \mu \mathrm{~s}$ |
| :--- | :--- |
| Horizontal MAG | $\times 10$ |

h. Select 20-ns time markers from the timemark generator.
i. Use the Horizontal POSITION controls to align the first time marker that is 50 ns beyond the start of the sweep with the second vertical graticule line.
j. CHECK-Timing accuracy is within $4 \%$ ( 0.32 division at the tenth vertical graticule line), and linearity is within $7 \%$ ( 0.14 division over any 2 of the center 8 divisions). Exclude any portion of the sweep past the 50th magnified division.
k. Repeat parts $i$ and $j$ for the remaining SEC/DIV and time-mark generator setting combination shown in Table 5-4 under the "X10 Magnified" column.
I. Disconnect the test equipment from the instrument.

## 9. Adjust X-Axis Gain (R395)

a. Set:

| VOLTS/DIV (both) | 10 mV |
| :--- | :--- |
| SEC/DIV | $\mathrm{X}-\mathrm{Y}$ |
| Horizontal MAG | X 1 |

Table 5-4
Settings for Timing Accuracy Checks

| SECIDIV <br> SWitch <br> Setting | Time-Mark Generator Setting |  |
| :---: | :---: | :---: |
|  | X1 Normal | X10 Magnified |
| $0.1 \mu \mathrm{~s}$ | $0.1 \mu \mathrm{~s}$ | 20 ns |
| $0.2 \mu \mathrm{~s}$ | $0.2 \mu \mathrm{~s}$ | 20 ns |
| $0.5 \mu \mathrm{~s}$ | $0.5 \mu \mathrm{~s}$ | 50 ns |
| $1 \mu \mathrm{~s}$ | $1 \mu \mathrm{~s}$ | $0.1 \mu \mathrm{~s}$ |
| $2 \mu \mathrm{~s}$ | $2 \mu \mathrm{~s}$ | $0.2 \mu \mathrm{~s}$ |
| $5 \mu \mathrm{~s}$ | $5 \mu \mathrm{~s}$ | $0.5 \mu \mathrm{~s}$ |
| $10 \mu \mathrm{~s}$ | $10 \mu \mathrm{~s}$ | $1 \mu \mathrm{~s}$ |
| $20 \mu \mathrm{~s}$ | $20 \mu \mathrm{~s}$ | $2 \mu \mathrm{~s}$ |
| $50 \mu \mathrm{~s}$ | $50 \mu \mathrm{~s}$ | $5 \mu \mathrm{~s}$ |
| 0.1 ms | 0.1 ms | $10 \mu \mathrm{~s}$ |
| 0.2 ms | 0.2 ms | $20 \mu \mathrm{~s}$ |
| 0.5 ms | 0.5 ms | $50 \mu \mathrm{~s}$ |
| 1 ms | 1 ms | 0.1 ms |
| 2 ms | 2 ms | 0.2 ms |
| 5 ms | 5 ms | 0.5 ms |
| 10 ms | 10 ms | 1 ms |
| 20 ms | 20 ms | 2 ms |
| 50 ms | 50 ms | 5 ms |
| 0.1 s | 0.1 s | 10 ms |
| 0.2 s | 0.2 s | 20 ms |
| 0.5 s | 0.5 s | 50 ms |

b. Connect a $50-\mathrm{mV}$, standard-amplitude signal from the calibration generator via a $50-\Omega$ coaxial cable to the CH 1 OR $X$ input connector.
c. ADJUST-X Gain (R395) for exactly 5 divisions of horizontal deflection.
10. Adjust $X$ Offset (R736)
a. Set:
$\begin{array}{ll}\text { Channel } 1 \text { AC-GND-DC } & \text { GND } \\ \text { SEC/DIV } & 1 \mathrm{~ms}\end{array}$
b. Position the trace vertically to the center horizontal graticule line.
c. Position the trace horizontally so the start of the trace begins at the first vertical graticule line (extreme left).
d. Set the SEC/DIV switch to $X-Y$ (fully counterclockwise).
e. ADJUST-X Offset (R736) to position the spot at the seventh vertical graticule line.
f. Disconnect the test equipment from the instrument.

## 10. Check X Bandwidth

a. Set:

| VOLTS/DIV (both) | 50 mV |
| :--- | :--- |
| AC-GND-DC (both) | DC |
| Trigger SOURCE | CH 1 |

b. Connect the leveled sine-wave generator output via a $50-\Omega$ coaxial cable and a $50-\Omega$ termination to the CH 1 OR $X$ input connector.
c. Set the generator to produce an 8 -division horizontal display at an output frequency of 50 kHz .
d. Increase the signal frequency until the horizontal deflection ( X -axis) is equal to 5.7 divisions in length.
e. CHECK-The frequency is greater than 2 MHz .
f. Disconnect the test equipment from the instrument.

## 11. Check Sweep Holdoff

a. Set:

| VOLTS/DIV (both) | 1 V |
| :--- | :--- |
| AC-GND-DC (both) | GND |
| SEC/DV | 1 ms |
| Trigger SOURCE | EXT, EXT |

b. Connect the test oscilloscope's 10X probe tip to the front end of R704 (toward the front panel). R704 is on the Timing circuit board.
c. CHECK-Holdoff time is between 1.5 ms to 3.0 ms .
d. Repeat part c for SEC/DIV switch settings in Table 5-5.
e. Disconnect the 10X probe from R704.

Table 5-5
Settings for Holdoff Checks

| SEC/DIV | Holdoff Time |
| :---: | :---: |
| 0.1 ms | 0.2 ms to 0.3 ms |
| $10 \mu \mathrm{~s}$ | $15 \mu \mathrm{~s}$ to $30 \mu \mathrm{~s}$ |
| $1 \mu \mathrm{~s}$ | $1.5 \mu \mathrm{~s}$ to $3.0 \mu \mathrm{~s}$ |

## TRIGGER

## Equipment Required (See Table 4-1):

Leveled Sine-Wave Generator (Item 2)
$50-\Omega$ Coaxial Cale (Item 6)
Dual-Input Coupler (Item 7)
$50-\Omega$ Termination (Item 8)
Alignment Tool (Item 11)

See AbJustment locations 1
at the back of this manual for adjustment locations.

## PROCEDURE STEPS

## 1. Adjust Trigger Offset Balance(R338)

a. Set the Channel 1 trace and the Channel 2 trace to the center horizontal graticule line using the Channel 1 and Channel 2 POSITION controls.
b. Connect the digital voltmeter low lead to chassis ground and the high (volts) lead to TP350 (base of Q410).
c. CHECK-The offset voltage reading is less than 100 mV . Note the reading for use in part e.
d. Set the Trigger SOURCE switch to CH 1.
e. ADJUST-Trig Offset Bal (R338) so that the voltage reading is the same as that obtained in part c .
f. Set the Trigger SOURCE switch to CH 2.
g. Repeat parts c through $f$ until there is 1 mV or less difference in the voltmeter readings between the CH 1 and CH 2 positions of the Trigger SOURCE switch.
h. Disconnect the test equipment from the instrument.
2. Adjust Trigger Sensitivity (R489)
a. Set:

| Vertical MODE | CH 1 |
| :--- | :--- |
| CH 1 VOLTS/DIV | 0.1 V |
| AC-GND-DC (both) | AC |
| SEC/DIV | $10 \mu \mathrm{~s}$ |
| Trigger SOURCE | VERT MODE |

b. Connect the leveled sine-wave generator output via a $50-\Omega$ cable and a $50-\Omega$ termination to the CH 1 OR $X$ input connector.
c. Set the generator to produce a $50-\mathrm{kHz}$, 2.2-division display.
d. Set the CH 1 VOLTS/DIV switch to 1 V .
e. ADJUST-Trig Sensitivity (R489) while rotating the Trigger LEVEL control slowly so that the trigger is just able to be maintained.
f. CHECK-The TRIG'D/READY LED is on when triggered.

## 3. Adjust Slope Balance (R481)

a. Set the CH 1 VOLTS/DIV switch to 50 mV .
b. Set the generator to produce a 4-division display.
c. ADJUST-Slope Bal (R481) for a downward vertical shift of 0.22 -division at the start of the sweep when changing the Trigger SLOPE switch between the positive ( $-\checkmark$ ) and negative ( $\neg$ ) positions.

## 4. Adjust Auto Level (R445 and R446)

a. Set:

## Trigger SLOPE <br> Trigger LEVEL

Positive ( $-\widetilde{\text { ) }}$
Fully clockwise
b. Set the generator to produce a 5-division display.
c. Set the CH 1 VOLTS/DIV switch to 0.5 V .
d. ADJUST-(+) Auto Level (R446) so that the vertical display just solidly triggers on the positive peak of the signal.
e. Set:

Trigger SLOPE
Trigger LEVEL
Negative (乙)
Fully
counter-
clockwise
f. ADJUST-(-) Auto Level (R445) so that the display just solidly triggers on the negative peak of the signal.
5. Check Internal Triggering
a. Set:

CH 1 VOLTS/DIV
5 mV
CH 2 VOLTS/DIV
50 mV
SEC/DIV
b. Set the generator to produce a $5-\mathrm{MHz}$, 3 -division display.
c. Set the CH 1 VOLTS/DIV switch to 50 mV .
d. CHECK-Stable display can be obtained by adjusting the Trigger LEVEL control for each switch combination given in Table 5-6. Ensure that the TRIG'D/READY LED comes on when triggered.

Table 5-6
Switch Combinations for Triggering Checks

| Trigger MODE | Trigger SLOPE |
| :---: | :---: |
| NORM | Positive $\ulcorner$ |
| NORM | Negative $\urcorner$ |
| P-P AUTO | Negative $\neg$ |
| P-P AUTO | Positive $\ulcorner$ |

e. Move the cable from the CH 1 OR $X$ input connector to the CH 2 OR $Y$ input connector. Set the Vertical MODE switch to CH 2.
f. Repeat part d.
g. Set:

| SEC/DIV | $0.1 \mu \mathrm{~s}$ |
| :--- | :--- |
| Horizontal MAG | $\times 10$ |

h . Set the generator to produce a $30-\mathrm{MHz}$, 1.0-division display.
i. Repeat part d.
j. Move the cable from the CH 2 OR $Y$ input connector to the CH 1 OR $X$ input connector. Set the Vertical Mode switch to CH 1.
k. Repeat part d.
I. Disconnect the test equipment from the instrument.

## 6. Check External Triggering

a. Set:

| CH 1 VOLTS/DIV | 20 mV |
| :--- | :--- |
| SEC/DIV | 0.2 ms |
| Horizontal MODE | $\times 1$ |
| Trigger MODE | P-P AUTO |
| Trigger SOURCE | EXT, EXT |

b. Connect the leveled sine-wave generator output via a $50-\Omega$ coaxial cable, a $50-\Omega$ termination,
and a dual-input coupler to the $\mathrm{CH} 1 \mathrm{OR} X$ input connector and EXT INPUT OR $Z$ input connectors.
c. Set the generator to produce a 4-division ( 80 mV ) horizontal display at an output frequency of 5 MHz .
d. CHECK-Stable display can be obtained by adjusting the Trigger LEVEL control for each switch combination given in Table 4-4.
e. Set:

| CH 1 VOLT/DIV | 50 mV |
| :--- | :--- |
| SEC/DIV | 0.05 ms |
| Horizontal MODE | MAG |

f. Set the leveled sine-wave generator to produce a $50-\mathrm{kHz}, 3$-division ( 150 mV ) display.
g. Set the generator output to 30 MHz .
h. Repeat part d.
7. Check External Trigger Range
a. Set:

CH 1 VOLTSIDIV
0.5 V

SEC/DIV
20 ms
Trigger SLOPE
Positive ( -5 )
b. Set the leveled sine-wave generator to produce a $50-\mathrm{kHz}, 6.4$-division display.
c. Position the waveform equally about the center horizontal graticule line.
d. Set:

Trigger MODE
NORM
Trigger SOURCE
e. CHECK—Display is triggered along the entire positive slope of the waveform as the Trigger LEVEL control is rotated.
f. CHECK-Display is not triggered at either extreme of rotation of the Trigger LEVEL control.
g. Set the Trigger SLOPE switch to negative ( ᄂ).
h. CHECK-Display is triggered along the entire negative slope of the waveform as the Trigger LEVEL control is rotated.
i. CHECK-Display is not triggered at either extreme of rotation of the Trigger LEVEL control.
j. Disconnect the test equipment from the instrument.

## 8. Check Single Sweep Operation

a. Set:

| CH 1 VOLTS/DIV | 10 mV |
| :--- | :--- |
| SEC/DIV | 0.5 ms |
| Trigger SOURCE | CH 1 |
| Trigger SLOPE | Positive $(\Gamma)$ |

b. Connect $50-\mathrm{mV}$, standard-amplitude signal from the calibration generator via a $50-\Omega$ coaxial cable to the CH 1 OR X input connector.
c. Adjust the Trigger LEVEL control to obtain a stable display.
d. Set:

Channel 1 AC-GND-DC
GND
Trigger MODE SGL SWP
e. Press the SGL SWP RESET button. The TRIG'D/READY LED illuminates and remains on.
f. Set the Channel $1 A C-G N D-D C$ switch to $D C$.

## NOTE

The INTENSITY control may require adjustment to observe the single-sweep trace.
g. CHECK-TRIG'D/READY LED goes out and a single swéep occurs.
h. Press the SGL SWP RESET button several times.
i. CHECK-A single-sweep trace occurs, and the TRIG'D/READY LED illuminates briefly every time the SGL SWP RESET button is pressed.
j. Disconnect the test equipment from the instrument.

## EXTERNAL Z-AXIS AND PROBE ADJUST

```
Equipment Required (See Table 4-1):
    Calibration Generator (Item 1)
    Two 50-\Omega Coaxial Cables (Item 6)
    Dual-Input Coupler (Item 7)
50-\Omega Termination (Item 8)
10X Probe (Item 12)
```

## INITIAL CONTROL SETTINGS

P-P AUTO
EXT, EXT $=Z$

## PROCEDURE STEPS

## 1. Check External Z-Axis Operation

a. Connect a 5-V standard-amplitude signal from the calibration generator via dual-input coupler to the CH 1 OR $X$ and EXT INPUT OR $Z$ connectors.

## NOTE

The INTENSITY level may need adjustment to view the intensity modulation on the displayed waveform.
b. CHECK-For noticeable intensity modulation. The positive part of the sine wave should be of lower intensity than the negative part.
c. Disconnect the test equipment from the instrument.

## 2. Check Probe Adjust Operation

a. Set:

| CH 1 VOLTS/DIV | 10 mV |
| :--- | :--- |
| SEC/DIV | 0.5 ms |
| Trigger SOURCE | CH 1 |

b. Connect the $10 \times$ Probe to the CH 1 OR $X$ input connector and clip the probe tip to the PROBE connector on the instrument front panel. If necessary, adjust the probe compensation for a flat-topped square-wave display.
c. CHECK—Display amplitude is 4.75 to 5.25 divisions.
d. Disconnect the probe from the instrument.

## MAINTENANCE

This section contains information for conducting preventive maintenance, troubleshooting, and corrective maintenance on the instrument. Circuit
board removal procedures are included in the Corrective Maintenance part of this section.

## STATIC-SENSITIVE COMPONENTS

The following precautions are applicable when performing any maintenance involving internal access to the instrument.

## $\{$ CAUTION $\}$

Static discharge can damage any semiconductor component in this instrument.

This instrument contains electrical components that are susceptible to damage from static discharge. Table 6-1 lists the relative susceptibility of various classes of semiconductors. Static voltages of 1 KV to 30 KV are common in unprotected environments.

When performing maintenance, observe the following precautions to avoid component damage:

1. Minimize handling of static-sensitive components.
2. Transport and store static-sensitive components or assemblies in their original containers or on a metal rail. Label any package that contains static-sensitive components or assemblies.
3. Discharge the static voltage from your body by wearing a grounded antistatic wrist strap while handling these components. Servicing staticsensitive components or assemblies should be performed only at a static-free work station by qualified service personnel.
4. Nothing capable of generating or holding a static charge should be allowed on the work station surface.

Table 6-1
Relative Susceptibility to Static-Discharge Damage

| Semiconductor Classes | Relative <br> Susceptibility <br> Levels $^{\text {a }}$ |
| :--- | :---: |
| MOS or CMOS microcircuits or <br> discretes, or linear microcircuits <br> with MOS inputs (Most Sensi- <br> tive) |  |
| ECL | 1 |
| Schottky signal diodes | 2 |
| Schottky TTL | 3 |
| High-frequency bipolar <br> transistors | 4 |
| JFET | 5 |
| Linear microcircuits | 6 |
| Low-power Schottky TTL | 7 |
| TTL | 8 |

${ }^{a}$ Voltage equivalent for levels (voltage discharged from a $100-\mathrm{pF}$ capacitor through a resistance of $100 \Omega$ ):

$$
1=100 \text { to } 500 \mathrm{~V}
$$

$$
\begin{aligned}
& 2=200 \text { to } 500 \mathrm{~V} \\
& 3=250 \mathrm{~V}
\end{aligned}
$$

$$
6=600 \text { to } 800 \mathrm{~V}
$$

$$
3=250 \mathrm{~V}
$$

$$
7=400 \text { to } 1000 \vee \text { (est) }
$$

$$
\begin{aligned}
& 4=500 \vee \\
& 5=400 \text { to } 600 \vee
\end{aligned}
$$

$$
\begin{aligned}
& 8=900 V \\
& 9=1200 V
\end{aligned}
$$

5. Keep the component leads shorted together whenever possible.
6. Pick up components by their bodies, never by their leads.
7. Do not slide the components over any surface.
8. Avoid handling components in areas that have a floor or work-surface covering capable of generating a static charge.
9. Use a soldering iron that is connected to earth ground.
10. Use only approved antistatic, vacuum-type desoldering tools for component removal.

## PREVENTIVE MAINTENANCE

## INTRODUCTION

Preventive maintenance consists of cleaning, visual inspection, and checking instrument performance. When performed regularly, it may prevent instrument malfunction and enhance instrument reliability. The severity of the environment in which the instrument is used determines the required frequency of maintenance. An appropriate time to accomplish preventive maintenance is just before instrument adjustment.

## GENERAL CARE

The cabinet minimizes accumulation of dust inside the instrument and should normally be in place when operating the oscilloscope. The optional front cover for the instrument provides both dust and damage protection for the front panel and crt. Whenever the instrument is stored or is being transported, the front cover should be used.

Do not use chemical cleaning agents that might damage the plastics used in this instrument. Use a nonresidue-type cleaner, preferably isopropyl alcohol or a solution of $1 \%$ mild detergent with 99\% water. Before using any other type of cleaner, consult your Tektronix Service Center or representative.

## INSPECTION AND CLEANING

The instrument should be inspected and cleaned as often as operating conditions require. Accumulation of dust in the instrument can cause overheating and component breakdown. Dust on components acts as an insulating blanket, preventing efficient heat dissipation. It also provides an electrical conduction
path that could result in instrument failure, especially under high-humidity conditions.

## Exterior

INSPECTION. Inspect the external portions of the instrument for damage, wear, and missing parts; use Table 6-2 as a guide. Instruments that appear to have been dropped or otherwise abused should be checked thoroughly to verify correct operation and performance. Any problems found that could cause personal injury or could lead to further damage to the instrument should be repaired immediately.
$\{$ CAUTION\}

Do not allow moisture to get inside the instrument during external cleaning. Use only enough liquid to dampen the cloth or applicator.

CLEANING. Loose dust on the outside of the instrument can be removed with a soft cloth or small soft-bristle brush. The brush is particularly useful for dislodging dirt on and around the controls and connectors. Dirt that remains can be removed with a soft cloth dampened in a mild detergent-and-water solution. Do not use abrasive cleaners.

A plastic light filter is provided with the oscilloscope. Clean the light filter and the crt face with a soft lint-free cloth dampened with either isopropyl alcohol or a mild detergent-and-water solution.

## Interior

To gain access to internal portions of the instrument for inspection and cleaning, refer to the Removal and Replacement Instructions in the Corrective Maintenance part of this section.

Table 6-2
External Inspection Checklist

| Item | Inspect For | Repair Action |
| :--- | :--- | :--- |
| Cabinet and Front Panel | Cracks, scratches, deformations, <br> and damaged hardware or gaskets. | Touch up paint scratches and <br> replace defective parts. |
| Front-panel controls | Missing, damaged, or loose knobs, <br> buttons, and controls. | Repair or replace missing or <br> defective items. |
| Connectors | Broken shells, cracked insulation, <br> and deformed contacts. Dirt in <br> connectors. | Replace defective parts. Clean or <br> wash out dirt. |
| Carrying Handle | Correct operation. | Replace defective parts. |
| Accessories | Missing items or parts of items, <br> bent pins, broken or frayed cables, <br> and damaged connectors. | Replace damaged or missing items, <br> frayed cables, and defective <br> parts. |
| Cabinet and Front Panel | Cracks, scratches, deformations, <br> and damaged hardware or gaskets. | Touch up paint scratches and <br> replace defective parts. |
| Front-panel controls | Missing, damaged, or loose knobs, <br> buttons, and controls. | Repair or replace missing or <br> defective items. |
| Connectors | Broken shells, cracked insulation, <br> and deformed contacts. Dirt in <br> connectors. | Replace defective parts. Clean or <br> wash out dirt. |
| Carrying Handle | Correct operation. | Replace defective parts. |
| Accessories | Missing items or parts of items, <br> bent pins, broken or frayed cables, <br> and damaged connectors. | Replace damaged or missing items, <br> frayed cables, and defective <br> parts. |

INSPECTION. Inspect the internal portions of the instrument for damage and wear, using Table 6-3 as a guide. Deficiencies found should be repaired immediately. The corrective procedure for most visible defects is obvious; however, particular care must be taken if heat-damaged components are found. Overheating usually indicates other trouble in the instrument; therefore, it is important that the cause of overheating be corrected to prevent recurrence of the damage.

If any electrical component is replaced, conduct a performance check for the affected circuit and for other closely related circuits (see Section 4). If repair or replacement work is done on any of the power supplies, conduct a complete performance check and, if so indicated, an instrument readjustment (see Sections 4 and 5).

To prevent damage from electrical arcing, ensure that circuit boards and components are dry before applying power to the instrument.

CLEANING. To clean the interior, blow off dust with dry, low-pressure air (approximately 9 psi). Remove any remaining dust with a soft brush or a cloth dampened with a solution of mild detergent and water. A cotton-tipped applicator is useful for cleaning in narrow spaces and on circuit boards.

VOLT/DIV And SEC/DIV SWITCHES. These are maintenance free. DO NOT CLEAN.

Table 6-3
Internal Inspection Checklist

| Item | Inspect For | Repair Action |
| :--- | :--- | :--- |
| Circuit Boards | Loose, broken, or corroded solder <br> connections. Burned circuit boards. <br> Burned, broken, or cracked <br> circuit-run plating. | Clean solder corrosion with an <br> eraser and flush with isopropyl <br> alcohol. Resolder defective con- <br> nections. Determine cause of <br> burned items and repair. Repair <br> defective circuit runs. |
| Resistors | Burned, cracked, broken, or <br> blistered. | Replace defective resistors. Check <br> for cause of burned component <br> and repair as necessary. |
| Solder Connections | Cold solder or rosin joints. | Resolder joint and clean with <br> isopropyl alcohol. |
| Capacitors | Damaged or leaking cases. <br> Corroded solder on leads or <br> terminals. | Replace defective capacitors. Clean <br> solder connections and flush with <br> isopropyl alcohol. |
| Wiring and Cables | Loose plugs or connectors. Burned, <br> broken, or frayed wiring. | Firmly seat connectors. Repair or <br> replace defective wires or cables. |
| Chassis | Dents, deformations, and damaged <br> hardware. | Straighten, repair, or replace <br> defective hardware. |

Most spray-type circuit coolants contain Freon 12 as a propellant. Because many Freons adversely affect switch contacts, do not use spray-type coolants on the switches or attenuators. Carbon based solvents will damage the circuit board material.

## LUBRICATION

Most of the potentiometers used in this instrument are permanently sealed and generally do not require periodic lubrication. All switches, both rotary- and lever-type, are installed with proper lubrication applied where necessary and will rarely require any additional lubrication. A regular periodic lubrication program for the instrument is, therefore, not recommended.

## SEMICONDUCTOR CHECKS

Periodic checks of the transistors and other semiconductors in the oscilloscope are not recommended. The best check of semiconductor performance is actual operation in the instrument.

## PERIODIC READJUSTMENT

To ensure accurate measurements, check the performance of this instrument every 2000 hours of operation, or if used infrequently, once each year. In addition, replacement of components may necessitate readjustment of the affected circuits.

Complete performance check and adjustment instructions are given in Sections 4 and 5. The performance check procedure can also be helpful in localizing certain troubles in the instrument. In some cases, minor problems may be revealed or corrected by readjustment. If only a partial adjustment is performed, see the interaction chart, Table 5-1, for possible adjustment interaction with other circuits.

## TROUBLESHOOTING

## INTRODUCTION

Preventive maintenance performed on a regular basis should reveal most potential problems before an instrument malfunctions. However, should troubleshooting be required, the following information is provided to facilitate location of a fault. In addition, the material presented in the Theory of Operation and Diagrams sections of this manual may be helpful while troubleshooting.

## TROUBLESHOOTING AIDS

## Schematic Diagrams

Complete schematic diagrams are located on tabbed foldout pages in the Diagrams section. Portions of circuitry mounted on each circuit board are enclosed by heavy black lines. The assembly number and name of the circuit are shown near either the top or the bottom edge of the enclosed area.

Functional blocks on schematic diagrams are outlined with a wide grey line. Components within the outlined area perform the function designated by the block label. The Theory of Operation uses these functional block names when describing circuit operation as an aid in cross-referencing between the theory and the schematic diagrams.

Component numbers and electrical values of components in this instrument are shown on the schematic diagrams. Refer to the first page of the Diagrams section for the reference designators and symbols used to identify components. Important voltages and waveform reference numbers (enclosed in hexagonal-shaped boxes) are also shown on each diagram. Waveform illustrations are located adjacent to their respective schematic diagram.

## Circuit Board Illustrations

Circuit board illustrations showing the physical location of each component are provided for use in conjunction with each schematic diagram. Each circuit board illustration is found in the Diagrams section on the back of a foldout page, preceding the first schematic diagram(s) to which it relates.

The locations of waveform test points are marked on the circuit board illustrations with hexagonal outlined numbers corresponding to the waveform numbers on both the schematic diagram and the waveform illustrations.

Also provided in the Diagrams section is an illustration of the bottom side of the Main circuit board. This illustration aids in troubleshooting by showing the connection pads for the components mounted on the top side of the circuit board. By using this illustration, circuit tracing and probing for voltages and signals that are inaccessible from the top side of the circuit board may be achieved without dismantling portions of the instrument.

## Circuit Board Locations

The placement of each circuit board in the instrument is shown in circuit board locator illustrations. These illustrations are located on foldout pages along with the circuit board illustration.

## Circuit Board Interconnections

Circuit Board Interconnections (Diagram 9) is provided as an aid in tracing a signal path between circuit boards. All wire, plug, and jack numbers are shown along with their associated wire or pin numbers.

## Power Distribution

Power Distribution (Diagram 8) is provided to aid in troubleshooting power-supply problems. This diagram shows the service jumper connections used to apply power to the various circuit boards. Excessive loading on a power supply by a circuit board fault may be isolated by disconnecting the appropriate service jumpers.

## Grid Coordinate System

Each schematic diagram and circuit board illustration has a grid border along its left and top edges. A table located adjacent to each diagram lists the grid coordinates of each component shown on that diagram. To aid in physically locating components on the circuit board, this table also lists the grid coordinates of each component on the circuit board illustration.

Near each circuit board illustration is an alphanumeric listing of all components mounted on that circuit board. The second column in each listing identifies the schematic diagram in which each component can be found. These component-locator tables are especially useful when more than one schematic diagram is associated with a particular circuit board.

## Component Color Coding

Information regarding color codes and markings of resistors and capacitors is located on the colorcoding illustration (Figure 9-1) at the beginning of the Diagrams section.

RESISTOR COLOR CODE. Resistors used in this instrument are carbon-film, composition, or precision metal-film types. They are usually color coded with the EIA color code; however, some metal-film type resistors may have the value printed on the body. The color code is interpreted starting with the stripe nearest to one end of the resistor. Composition resistors have four stripes; these represent two significant digits, a multiplier, and a tolerance value. Metal-film resistors have five stripes representing three significant digits, a multiplier, and a tolerance value.

CAPACITOR MARKINGS. Capacitance values of common plastic capacitors and small electrolytics are marked on the side of the capacitor body. Small, machine-insertable capacitors are numerically coded in picofarads. The first two numbers are the significant digits and the third number (if a three-number code) is the number of zeros following the digits. When there are two numbers separated by the letter "R", the two numbers are the significant digits; the letter marks the radix (decimal point). Some examples of this type of capacitor coding are as follows:
$475=4700000 \mathrm{pF}=4.7 \mu \mathrm{~F}$
$472=4700 \mathrm{pF}=0.0047 \mu \mathrm{~F}$
$471=470 \mathrm{pF}$
$470=47 \mathrm{pF}$
$4 R 7=4.7 \mathrm{pF}$
The code numbers may be difficult to locate and read on installed parts. Capacitor values may be found by referencing the circuit designation number in the Replaceable Electrical Parts list.

DIODE COLOR CODE. The cathode end of each glass-encased diode is indicated by either a stripe, a series of stripes or a dot. For most diodes marked with a series of stripes, the color combination of the stripes identifies three digits of the Tektronix Part Number, using the resistor color-code system. The
cathode and anode ends of a metal-encased diode may be identified by the diode symbol marked on its body.

## Semiconductor Lead Configurations

Figure 9-2 in the Diagrams section shows the lead configurations for semiconductor devices used in the instrument. These lead configurations and case styles are typical of those used at completion of the instrument design. Vendor changes and performance improvement changes may result in changes of case styles or lead configurations. If the device in question does not appear to match the configuration shown in Figure 9-2, examine the associated circuitry or consult the manufacturer's data sheet.

## TROUBLESHOOTING EQUIPMENT

The equipment listed in Table 4-1 of this manual, or equivalent equipment, may be useful when troubleshooting this instrument.

## TROUBLESHOOTING TECHNIQUES

The following procedure is arranged in an order that enables checking simple trouble possibilities before requiring more extensive troubleshooting. The first four steps ensure proper control settings, connections, operation, and adjustment. If the trouble is not located by these checks, the remaining steps will aid in locating the defective component. When the defective component is located, replace it using the appropriate replacement procedure given under Corrective Maintenance in this section.

Before: using any test equipment to make measurements on static-sensitive, currentsensitive, or voltage-sensitive components or assemblies, ensure that any voltage or current supplied by the test equipment does not exceed the limits of the component to be tested.

## 1. Check Control Settings

Incorrect control settings can give a false indication of instrument malfunction. If there is any question about the correct function or operation of any control, refer to either the Operating Information in Section 2 of this manual or to the Operators Manual.

## 2. Check Associated Equipment

Before proceeding, ensure that any equipment used with the instrument is operating correctly. Verify that input signals are properly connected and that the interconnecting cables are not defective. Check that the ac-power-source voltage to all equipment is correct.

To avoid electrical shock, disconnect the instrument from the ac power source before making a visual inspection of the internal circuitry.

## 3. Visual Check

Perform a visual inspection. This check may reveal broken connections or wires, damaged components, semiconductors not firmly mounted, damaged circuit boards, or other clues to the cause of an instrument malfunction.

## WARNING

Dangerous potentials exist at several points throughout this instrument. If it is operated with the cabinet removed, do not touch exposed connections or components.

## 4. Check Instrument Performance and Adjustment

Check the performance of either those circuits where trouble appears to exist or the entire instrument. The apparent trouble may be the result of misadjustment. Complete performance check and adjustment instructions are given in Sections 4 and 5 of this manual.

## 5. Isolate Trouble to a Circuit

To isolate problems to a particular area, use any symptoms noticed to help locate the trouble. Refer to the troubleshooting charts in the Diagrams section as an aid in locating a faulty circuit.

## 6. Check Power Supplies

When trouble symptoms appear in more that one circuit, first check the power supplies; then check the affected circuits by taking voltage and waveform readings. Check first for the correct output voltage of each individual supply. These voltages are measured between the power supply test points and ground (see the associated circuit board illustration and Table 6-5).

Voltage levels may be measured either with a DMM or with an oscilloscope. Voltage ripple amplitudes must be measured using an oscilloscope. Before checking power-supply circuitry, set the INTENSITY control to normal brightness, the SEC/DIV switch to 0.1 ms , the Trigger MODE to P-P AUTO, and the Vertical MODE switch to CH 1.

When measuring ripple, use a $1 \times$ probe. The ripple values listed are based on a system limited in bandwidth to 30 kHz . Using a system with wider bandwidth will result in higher readings.

If the power-supply voltages and ripple are within the ranges listed in Table 6-4, the supply can be assumed to be working correctly. If they are outside the range, the supply may be either misadjusted or operating incorrectly. Use the Power Supply and CRT Display subsection in the Adjustment Procedure to adjust the $-8.6-\mathrm{V}$ supply.

A defective component elsewhere in the instrument can create the appearance of a power-supply problem and may also affect the operation of other circuits.

Table 6-4
Power Supply Voltage and Ripple Limits

| Power Supply | Test Point | Reading (Volts) | P-P Ripple |
| :---: | :---: | :---: | :---: |
| $-8.6 \mathrm{~V}_{1}$ | W 989 | -8.56 to -8.64 | 5 mV |
| $+5.0 \mathrm{~V}_{1}$ | W 991 | +4.85 to +5.15 | 5 mV |
| $+8.6 \mathrm{~V}_{1}$ | W 987 | +8.34 to +8.86 | 5 mV |
| +102.0 V | W 984 | +98.9 to +105.0 | 20 mV |
| +205.0 V | W 752 | +198.8 to +211.1 | 50 mV |
| +22 V unreg | Approx. +24 V | Approx. $1 \mathrm{~V}^{\mathrm{a}}$ |  |

[^4]
## 7. Check Circuit Board Interconnections

After the trouble has been isolated to a particular circuit, again check for loose or broken connections, improperly seated semiconductors, and heat-damaged components.

## 8. Check Voltages and Waveforms

Often the defective component can be located by checking circuit voltages or waveforms. Typical voltages are listed on the schematic diagrams. Waveforms indicated on the schematic diagrams by hexagonal-outlined numbers are shown adjacent to the diagrams. Waveform test points are shown on the circuit board illustrations.

#### Abstract

NOTE Voltages and waveforms indicated on the schematic diagrams are not absolute and may vary slightly between instruments. To establish operating conditions similar to those used to obtain these readings, see the Voltage and Waveform Setup Conditions preceding the waveform illustrations in the Diagrams section. Note the recommended test equipment, front-panel control settings, voltage and waveform conditions, and cableconnection instructions. Any special control settings required to obtain a given waveform are noted under the waveform illustration. Changes to the control settings from the initial setup, other than those noted, are not required.

## 9. Check Individual Components

To avoid electric shock, always disconnect the instrument from the ac power source before removing or replacing components.

The following procedures describe methods of checking individual components. Two-lead components that are soldered in place are most accurately checked by first disconnecting one end from the circuit board. This isolates the measurement from the effects of the surrounding circuitry.

See Figure 9-1 for component value identification and Figure 9-2 for semiconductor lead configurations.

## \{CAUTION\}

When checking semiconductors, observe the static-sensitivity precautions located at the beginning of this section.

TRANSISTORS. A good check of a transistor is actual performance under operating conditions. A transistor can most effectively be checked by substituting a known-good component. However, be sure that circuit conditions are not such that a replacement transistor might also be damaged. If substitute transistors are not available, use a dynamic-type transistor checker for testing. Static-type transistor checkers are not recommended, since they do not check operation under simulated operating conditions.

When troubleshooting transistors in the circuit with a voltmeter, measure both the emitter-to-base and emitter-to-collector voltages to determine whether they are consistent with normal circuit voltages. Voltages across a transistor may vary with the type of device and its circuit function.

Some of these voltages are predictable. The emitter-to-base voltage for a conducting silicon transistor will normally range from 0.6 V to 0.8 V . The emitter-to-collector voltage for a saturated transistor is about 0.2 V . Because these values are small, the best way to check them is by connecting a sensitive voltmeter across the junction rather than comparing two voltages taken with respect to ground. If the former method is used, both leads of the voltmeter must be isolated from ground.

If voltage values measured are less than those just given, either the device is shorted or no current is flowing in the external circuit. If values exceed the emitter-to-base values given, either the junction is reverse biased or the device is defective. Voltages exceeding those given for typical emitter-tocollector values could indicate either a nonsaturated device operating normally or a defective (opencircuited) transistor. If the device is conducting, voltage will be developed across the resistors in series with it; if open, no voltage will be developed across the resistors unless current is being supplied by a parallel path.

When checking emitter-to-base junctions, do not use an ohmmeter range that has a high internal current. High current may damage the transistor. Reverse biasing the emitter-to-base junction with a high current may degrade the current-transfer ratio (Beta) of the transistor.

A transistor emitter-to-base junction also can be checked for an open or shorted condition by measuring the resistance between terminals with an ohmmeter set to a range having a low internal source current, such as the $R \times 1-k W$ range. The junction resistance should be very high in one direction and much lower when the meter leads are reversed.

When troubleshooting a field-effect transistor (FET), the voltage across its elements can be checked in the same manner as previously described for other transistors. However, remember that in the normal depletion mode of operation, the gate-to-source junction is reverse biased; in the enhanced mode, the junction is forward biased.

INTEGRATED CIRCUITS. An integrated circuit (IC) can be checked with a voltmeter, test oscilloscope, or by direct substitution. A good understanding of circuit operation is essential when troubleshooting a circuit having IC components. Use care when checking voltages and waveforms around the IC so that adjacent leads are not shorted together. An IC test clip provides a convenient means of clipping a test probe to an IC.

When checking a diode, do not use an ohmmeter scale that has a high internal current. High current may damage a diode. Checks on diodes can be performed in much the same manner as those on transistor emitter-to-base junctions.

DIODES. A diode can be checked for either an open or a shorted condition by measuring the
resistance between terminals with an ohmmeter set to a range having a low internal source current, such as the $R \times 1-k \Omega$ range. The diode resistance should be very high in one direction and much lower when the meter leads are reversed.

Silicon diodes should have 0.6 V to 0.8 V across their junctions when conducting; Schottky diodes about 0.2 V to 0.4 V . Higher readings indicate that they are either reverse biased or defective, depending on polarity.

RESISTORS. Check resistors with an ohmmeter. Refer to the Replaceable Electrical Parts list for the tolerances of resistors used in this instrument. A resistor normally does not require replacement unless its measured value varies widely from its specified value and tolerance.

INDUCTORS. Check for open inductors by checking continuity with an ohmmeter. Shorted or partially shorted inductors can usually be found by checking the waveform response when highfrequency signals are passed through the circuit.

CAPACITORS. A leaky or shorted capacitor can best be detected by checking resistance with an ohmmeter set to one of the highest ranges. Do not exceed the voltage rating of the capacitor. The resistance reading should be high after the capacitor is charged to the output voltage of the ohmmeter. An open capacitor can be detected with a capacitance meter or by checking whether the capacitor passes ac signals.

## 10. Repair and Adjust the Circuit

If any defective parts are located, follow the replacement procedures given under Corrective Maintenance in this section. After any electrical component has been replaced, the performance of that circuit and any other closely related circuit should be checked. Since the power supplies affect all circuits, performance of the entire instrument should be checked if work has been done on the power supplies or if the power transformer has been replaced. Readjustment of the affected circuitry may be necessary. Refer to the Performance Check Procedure and Adjustment Procedure, Sections 4 and 5 of this manual and to Table 5-1 (Adjustments Affected by Repairs).

## CORRECTIVE MAINTENANCE

## INTRODUCTION

Corrective maintenance consists of component replacement and instrument repair. This part of the manual describes special techniques and procedures required to replace components in this instrument. If it is necessary to ship your instrument to a Tektronix Service Center for repair or service, refer to the repackaging information in Section 2 of this manual.

## MAINTENANCE PRECAUTIONS

To reduce the possibility of personal injury or instrument damage, observe the following precautions.

1. Disconnect the instrument from the acpower source before removing or installing components.
2. Verify that the line-rectifier filter capacitors are discharged prior to performing any servicing.
3. Use care not to interconnect instrument grounds which may be at different potentials (cross grounding).
4. When soldering on circuit boards or small insulated wires, use only a 15-watt, pencil-type soldering iron.

## OBTAINING REPLACEMENT PARTS

Most electrical and mechanical parts can be obtained through your local Tektronix Field Office or representative. However, many of the standard electronic components can usually be obtained from a local commercial source. Before purchasing or ordering a part from a source other than Tektronix, Inc., please check the Replaceable Electrical Parts list for the proper value, rating, tolerance, and description.

NOTE

Physical size and shape of a component may affect instrument performance, particularly at high frequencies. Always use directreplacement components, unless it is known that a substitute will not degrade instrument performance.

## Special Parts

In addition to the standard electronic components, some special parts are used in the instrument. These components are manufactured or selected by Tektronix, Inc., to meet specific performance requirements, or are manufactured for Tektronix, Inc., in accordance with our specifications. The various manufacturers can be identified by referring to the Cross Index-Manufacturer's Code number to Manufacturer at the beginning of the Replaceable Electrical Parts list. Most of the mechanical parts used in this instrument were manufactured by Tektronix, Inc. Order all special parts directly from your local Tektronix Field Office or representative.

## Ordering Parts

When ordering replacement parts from Tektronix, Inc., be sure to include all of the following information:

1. Instrument type (include all modification and option numbers).
2. Instrument serial number.
3. A description of the part (if electrical, include its full circuit component number).
4. Tektronix part number.

## MAINTENANCE AIDS

The maintenance aids listed in Table 6-5 include items required for performing most of the maintenance procedures in this instrument. Equivalent products may be substituted for those given, provided their characteristics are similar.

Table 6-5
Maintenance Aids

| Description | Specification | Usage | Example |
| :---: | :---: | :---: | :---: |
| 1. Soldering Iron | 15 to 25 W . | General soldering and unsoldering. | Antex Precision Model C. |
| 2. Torx Screwdriver | Torx tips \#T9 and \#T15. | Assembly and disassembly. | Tektronix p/n \#T9 003-0965-00 \#T15 003-0966-00 |
| 3. Nutdrivers | 1/4 inch, 7/16 inch, and $1 / 2$ inch. | Assembly and disassembly. | Xcelite \#8, \#10, \#14. and \#16. |
| 4. Open-end Wrench | 5/16 inch and $1 / 2$ inch. | Channel Input, EXT BNC connectors and Transformer. |  |
| 5. Hex Wrenches | 1/16 inch. | Assembly and disassembly. | Allen wrenches. |
| 6. Long-nose Pliers |  | Component removal and replacement. |  |
| 7. Diagonal Cutters |  | Component removal and replacement. |  |
| 8. Vacuum Solder Extractor | No Static Charge Retention. | Unsoldering components. | Pace Model PC-10. |
| 9. 1X Probe |  | Power supply ripple check. | Tektronix P6101 Probe (X1), p/n 010-6101-03. |
| 10. Lubricant | No-Noise. ${ }^{(®)}$ | Switch lubrication. | Tektronix p/n 006-0442-02. |

## RIBBON-CABLE CONNECTIONS

Connections between circuit boards are accomplished with ribbon cables. One end of the ribbon cables is inserted into the multipin connector while the other end is soldered to the circuit board. The ribbon cable to the multipin connector can be removed or installed by pressing down on the release bar of the connector as shown in Figure 6-1. To remove the ribbon cable, pull it straight out from the connector; to install the ribbon cable, insert the bare wires up to the insulation into the connector. Remove pressure from the release bare, the ribbon cable will be lock firmly into the connector.

To provide correct orientation of a cable, a number " 1 " is stamped on the circuit board and on top of the multipin connector. The index wire of the ribbon is striped a different color than the rest of the cable. Align the index wire with the pin 1 indicator when reinserting the ribbon cable into its connector. Ensure the ribbon cable is evenly trimmed and 5 mm of wire (about $1 / 4$ inch) is exposed for correct insertion into the connector.

If any individual wire in the cable is faulty, the entire ribbon cable should be replaced. When unsoldering the ribbon cable from the circuit board, note the location of the ribbon cable for reinstallation purposes. Align the index wire with the square pad on the circuit board.

Figure 6-1. Multi-connector holder orientation.

## TRANSISTORS AND INTEGRATED CIRCUITS

Transistors and integrated circuits should not be replaced unless they are actually defective. If removed from their sockets or unsoldered from the circuit board during routine maintenance, return them to their original circuit board locations. Unnecessary replacement or transposing of semiconductor devices may affect the adjustment of the instrument. When a semiconductor is replaced, check the performance of any circuit that may be affected.

Any replacement component should be of the original type or a direct replacement. Bend transistor leads to fit their circuit board holes, and cut the leads to the same length as the original component. See Figure 9-2 in the Diagrams section for leadconfiguration illustrations.

Power-supply transistors Q933, Q942, and Q946 are insulated from the chassis by a heat-transferring pad and insulation bushing. Reinstall the pad and bushing when replacing this transistor.

## NOTE

After replacing a power transistor, check that the collector is not shorted to the chassis before applying power to the instrument.

To remove socketed, dual-in-line-packaged (DIP) integrated circuits, pull slowly and evenly on both ends of the device. Avoid disengaging one end of the integrated circuit from the socket before the other, since this may damage the pins.

To remove a soldered DIP IC when it is going to be replaced, clip all the leads of the device and remove the leads from the circuit board one at a time. If the device must be removed intact for possible reinstallation, do not heat adjacent conductors consecutively. Apply heat to pins at alternate sides and ends of the IC as solder is removed. Allow a moment for the circuit board to cool before proceeding to the next pin.

## SOLDERING TECHNIQUES

The reliability and accuracy of this instrument can be maintained only if proper soldering techniques are used to remove or replace parts. General soldering techniques, which apply to maintenance of any precision electronic equipment, should be used when working on this instrument.

## WARNING

To avoid an electric-shock hazard, observe the following precautions before attempting any soldering: turn the instrument off, disconnect it from the ac power source, and wait at least three minutes for the line-rectifier filter capacitors to discharge.

Use rosin-core wire solder containing $63 \%$ tin and $37 \%$ lead. Contact your local Tektronix Field Office or representative to obtain the names of approved solder types.

When soldering on circuit boards or small insulated wires, use only a 15-watt, pencil-type soldering iron. A higher wattage soldering iron may cause etched-circuit conductors to separate from the circuit board base material and melt the insulation on small wires. Always keep the soldering-iron tip properly tinned to ensure best heat transfer from the iron tip to the solder joint. Apply only enough solder to make a firm joint. After soldering, clean the area around the solder connection with an approved flux-removing solvent (such as isopropyl alcohol) and allow it to air dry.

Attempts to unsolder, remove, and resolder leads from the component side of a circuit board may cause damage to the reverse side of the circuit board.

The following techniques should be used to replace a component on a circuit board:

1. Touch the vacuum desoldering tool to the lead at the solder connection. Never place the iron directly on the circuit board; doing so may damage the circuit board.

## NOTE

Some components are difficult to remove from the circuit board due to a bend placed in the component leads during machine insertion. To make removal of machineinserted components easier, straighten the component leads on the reverse side of the circuit board.
2. When removing a multipin component, especially an IC, do not heat adjacent pins consecutively. Apply heat to the pins at alternate sides and ends of the IC as solder is removed. Allow a moment for the circuit board to cool before proceeding to the next pin.

Excessive heat can cause the etched-circuit conductors to separate from the circuit board. Never allow the solder extractor tip to remain at one place on the circuit board for more than three seconds. Damage caused by poor soldering techniques can void the instrument warranty.
3. Bend the leads of the replacement component to fit the holes in the circuit board. If the component is replaced while the circuit board is installed in the instrument, cut the leads so they protrude only a small amount through the reverse side of the circuit board. Excess lead length may cause shorting to other conductive parts.
4. Insert the leads into the holes of the circuit board so that the replacement component is positioned the same as the original component. Most components should be firmly seated against the circuit board.
5. Touch the soldering iron to the connection and apply enough solder to make a firm solder joint.

Do not move the component while the solder hardens.
6. Cut off any excess lead protruding through the circuit board (if not clipped to the correct length in step 3).
7. Clean the area around the solder connection with an approved flux-removing solvent. Be careful not to remove any of the printed information from the circuit board.

## REMOVAL AND REPLACEMENT INSTRUCTIONS

The exploded view drawings in the Replaceable Mechanical Parts list (Section 10) may be helpful during the removal and reinstallation of individual subassemblies or components. Circuit board and component locations are shown in the Diagrams section.

## Cabinet

## WARNING

To avoid electric shock, disconnect the instrument from the ac-power-input source before removing or replacing any component or assembly.

To remove the instrument cabinet, perform the following steps:

1. Disconnect the power cord from the instrument. For instruments with a power-cord securing clamp, remove the Phillips-head screw holding the power-cord securing clamp before disconnecting the power cord.
2. Remove two screws and the two power cord retainers from the rear panel (located on each side). Remove the rear panel.
3. Remove two screws from the rear panel (located on each side) and remove it from the instrument.
4. Remove four screws, one from the left-rear side and three from the right-rear side of the cabinet.
5. Use one hand to rise the center rear of the cabinet until the tab clears the slot in the rear chassis. With the other hand, push the instrument chassis forward until it clears the cabinet tab.
6. Pull the front panel and attached chassis forward and out of the cabinet.
7. To reinstall the cabinet, perform the reverse of the preceding steps. Ensure that the cabinet tab is inserted in the rear-chassis slot, and the cabinet is flush with the rear of the chassis.
8. Reinstall the rear panel. Ensure the rear chassis tabs are inserted into the slots in the rear panel properly (slots are located just above the bottom rear feet), and the screw holes in the rear chassis and rear panel are properly aligned.
9. Reconnect the power cord and power-cord securing clamp (if removed in step 1).

## Cathode-Ray Tube

## WARNING

Use care when handling a crt. Breakage of the crt may cause high-velocity scattering of glass fragments (implosion). Protective clothing and safety glasses should be worn. Avoid striking the crt on any object which may cause it to crack or implode. When storing a crt, either place it in a protective carton or set it face down on a smooth surface in a protected location with a soft mat under the faceplate.

The crt can be removed and reinstalled as follows:

1. Unsolder the Trace Rotation wires (J987) from the Front-Panel circuit board (note the connection locations and wire colors for reinstallation reference).
2. Remove two front-panel screws that retain the plastic crt frame and light filter to the front panel. Remove the crt frame and light filter from the instrument.
3. With the rear of the instrument facing you, place the fingers of both hands over the front edge of the front subpanel. Then, using both thumbs, press forward gently on the crt funnel near the front of the crt. When the crt base pins disengage from the socket, remove the crt and the crt shield through the instrument front panel. Place the crt in a safe place until it is reinstalled. If the plastic crt corner pads fall out, save them for reinstallation.

## NOTE

When installing the crt into the instrument, reinstall any loose plastic crt corner pads that are out of place. Ensure all crt pins are straight and that the indexing keys on the crt base, socket, and shield are aligned. Ensure that the ground clip from the crt support bracket makes contact only with the outside of the crt shield.

To reinstall the crt, perform the reverse of the preceding steps.

## Power Transformer

The Power Transformer (T901) can be removed and reinstalled as follows:

1. Remove the top Power Supply shield by performing the following instructions.
a. Rotate the instrument until the rear chassis is facing you.
b. Using both hands, place the fingers underneath and the thumbs on top of the Power Supply shield.
c. Gently push the Power Supply shield towards the rear chassis and at the same time pull up on the shield until the tabs are clear of the slots in the inner chassis.
d. Pull the Power Supply shield towards the front of the instrument with a slight upward tilt until the rear tabs are clear of the slots in the rear chassis.
2. Disconnect P902, a seven-wire connector from J902 on the Mains input circuit board. Note the orientation of the connector for proper reinstallation.
3. Remove the four nuts and lock washers from the Power Transformer (inside the instrument) without removing the support screws (supporting the transformer) from the rear panel. Note the physical orientation of the Power Transformer.
4. Supporting the Transformer with one hand, pull the four screws out until the transformer is free (leaving the screws inside of the supports). Remove the transformer and the four screws and supports from the instrument.

To reinstall the Power Transformer, perform the reverse of the preceding steps.

## Mains Input Circuit Board

The Mains Input circuit board can be removed and reinstalled as follows:

1. Perform steps 1 and 2 of the Power Transformer procedure.
2. Unsolder W903, a three wire ribbon from Mains Input circuit board.
3. Remove the POWER knob shaft by inserting a scribe (or similar tool) in the notch between the end of the knob shaft and the end of the Power switch shaft and gentry pry the connection apart. Pull the POWER knob shaft out through the front panel.
4. Remove the two screws and nuts that secure the power cord receptacle to the rear chassis.
5. Remove the grounding screw and nut (top corner) that secure the Mains Input circuit board to the inner chassis.
6. Pull the Mains Input circuit board and attached shield towards the inner chassis and up out of the instrument.

To reinstall the Mains Input circuit board, perform the reverse of the preceding steps.

## Timebase/Attenuator Circuit Board Assembly

The Timebase/Attenuator circuit board assembly can be removed and reinstalled as follows:

1. Place the instrument on its side (CRT down) and unsolder the following wire straps and resistors, noting their locations for reinstallation reference:
a. Unsolder the two resistors from the CH 1 VOLTS/DIV and CH 2 VOLTS/DIV switches to the Front-Panel circuit board.
b. Unsolder the wire strap to the CH 1 OR $X$ connector ground lug from the Timebase/ Attenuator circuit board wire strap.
c. Unsolder the wire strap to the CH 2 OR $Y$ connector ground lug from the Timebase/ Attenuator circuit board wire strap.
d. Unsolder and pull the two wire straps from the Front-Panel circuit board that comes from the Attenuator circuit board.
2. Place the instrument down (normal position) and use a 1/16-inch hex wrench to loosen the set screws on the CH 1 VOLTS/DIV, CH 2 VOLTS/DIV, and SEC/DIV Variable knobs.
3. Remove CH 1 VOLTS/DIV, CH 2 VOLTS/DIV, and SEC/DIV Variable knobs and switch knobs from the instrument.
4. Disconnect the following cables from the Timebase/Attenuator circuit board assembly, noting their locations for reinstallation reference:
a. J90, a six-wire cable located at the rear edge of the circuit board.
b. J755, a four-wire cable located at the rear right-hand corner of the circuit board.
c. J30, a four-wire cable located to the left of the CH 1 attenuator switch.
d. J80, a four-wire cable located between the CH 1 and CH 2 attenuator switches.
e. J7, a six-wire cable located between the CH 2 attenuator switch and the SEC/DIV switch.
f. J701, a six-wire cable located at the front right-hand corner of the circuit board.
5. Remove the following three screws that secure the Timebase/Attenuator circuit board to the post spacers.
a. One screw from the right-rear corner of the Timebase/Attenuator circuit board assembly.
b. Two screws from the extreme left side of the Timebase/Attenuator circuit board assembly.
6. Remove the Focus knob shaft by pulling the shaft with one hand towards the front while holding the Focus pot shaft with the other hand.
7. Pull the Timebase/Attenuator circuit assembly board straight back from the front of the instrument until the attenuator switches are clear of the Front-Panel circuit board. Then lift out the entire assembly through the top of the instrument.

## NOTE

If accessibility to the bottom of the Timebasel Attenuator circuit board is desired perform steps 8 through 10.
8. Remove one screw from the center front bottom of the attenuator shield.
9. Remove two screws from the front corners of the Timebase/Attenuator circuit board and two nuts from the front corners of the attenuator shield.
10. Remove the attenuator shield by pulling it back until the shield tab clears the Timebase/ Attenuator ground bracket.

To reinstall the Timebase/Attenuator circuit board assembly, perform the reverse of the preceding steps.

## Front-Panel Circuit Board

The Front-Panel circuit board can be removed and reinstalled as follows:

1. Perform the Timebase/Attenuator circuit board assembly removal procedure.
2. Remove the knobs from the following control shafts by pulling them straight out from the front panel:
a. INTENSITY.
b. Channel 1 and Channel 2 POSITION.
c. Horizontal POSITION
e. LEVEL.
3. Turn the instrument on its side (CRT down) and unsolder the following wire straps and resistors underneath the instrument, noting their locations for reinstallation reference:
a. Unsolder the two resistors and bare straps to the CH 1 OR $X$ and $C H 2$ OR $Y$ connectors and ground lugs from the Front-Panel circuit board.
b. Unsolder the resistor and ground strap to the EXT INPUT OR Z connector and ground lug from the Front-Panel circuit board.
4. Turn the instrument over again and unsolder the Trace Rotation wires (J987) from the FrontPanel circuit board (note the connection locations and wire colors for reinstallation reference).
5. Remove the Power Switch extension shaft by disengaging from power switch and pulling it out through the Front-Panel circuit board.
6. Disconnect the following six-wire cables from the front edge of Main circuit board, noting their locations for reinstallation reference: $\mathfrak{J} 1, \mathfrak{J} 2, ~ J 3, ~ J 5, ~$ and J 6 .
7. Remove the five screws that secure the Front-Panel circuit board to the front chassis, noting their respective positions.
8. Remove the Front-Panel circuit board from the front chassis taking care not to lose the slider switch covers.

To reinstall the Front-Panel circuit board, perform the reverse of the preceding steps.

## Main Circuit Board

All components on the Main circuit board are accessible either directly or by removing either the crt, Power Transformer or the Timebase/Attenuator circuit board assembly. Removal of the Main circuit board is required only when it is necessary to replace the circuit board with a new one.

The Main circuit board can be removed and reinstalled as follows:

1. Perform the Cathode-Ray Tube removal procedure.
2. Perform step 1 of the Power Transformer procedure.
3. Unsolder the three-wire cable from the FOCUS potentiometer. The FOCUS potentiometer is located on the rear of the inner chassis.
4. Unsolder W893 from the Main circuit board. The cable is connected to the Focus pot located on the rear of the inner chassis.
5. Unsolder W903, a three ribbon from the Mains Input circuit board.

6 . Disconnect the following cables from the Timebase/Attenuator circuit board assembly, noting their locations for reinstallation reference:
a. J90, a six-wire cable located at the rear edge of the circuit board.
b. J755, a four-wire cable located at the rear right-hand corner of the circuit board.
c. J30, a four-wire cable located to the left of the CH 1 attenuator switch.
d. J80, a four-wire cable located between the CH 1 and CH 2 attenuator switches.
e. J7, a six-wire cable located between the CH 2 attenuator switch and the SEC/DIV switch.
f. J701, a six-wire cable located at the front right-hand corner of the circuit board.
7. Rotate the instrument until the rear chassis is facing you.
8. Remove the two screws (lower right corner) that secure the heat sink for the vertical output transistors to the rear chassis.
9. Remove the one screw (lower left corner) that secures the heat sink for the power supply transistors to the rear chassis.
10. Turn instrument upside down and rotate it until the front is facing you.
11. Unsolder the wire connected to the PROBE ADJUST terminal from the Main circuit board.
12. Remove the bottom power supply shield by inserting a narrow-blade screwdriver at each corner of the projecting edge and gently pry up until the two tabs are cleared of the slots in the Main circuit board. Pull and remove the shield out from underneath the rear chassis.
13. Remove four screws from the middle of the Main circuit board that secures the Timebase/ Attenuator post spacers and inner chassis to the Main circuit board.
14. Remove three screws and two nuts that secure the Main circuit board and Timebase/Attenuator spacer post to the left side of the chassis frame.
15. Remove three screws and nuts that secure the Main circuit board to the right side of the chassis frame.
16. Pull the Main circuit board forward to clear the guides on the rear chassis.

## NOTE

The front edge of the Main circuit board needs to be tilted out and away from the instrument to allow the removal of the ribbon cables.
17. Disconnect the following six-wire cables from the front edge of Main circuit board, noting their locations for reinstallation reference: $\mathrm{J} 1, \mathrm{~J} 2, \mathrm{~J} 3, \mathrm{~J} 5$, and J6.
18. Lift the Main circuit board out of the instrument.

To reinstall the Main circuit board, perform the reverse of the preceding steps. Ensure that the Main circuit board is secure in the guides of the rear chassis.

## OPTIONS AND ACCESSORIES

This section contains a general description of options that can be included with the original instrument order. Options available at the time of manual publication are listed as follows:

| Option 1C | Low Cost Camera |
| :---: | :---: |
| Option 1K | Instrument Cart |
| Option 1R | Rackmounting |
| Option 1T | Transit Case |
| Option 02 | Front Panel Cover and Accessories Pouch |
| Option 22 | 24-1X Signal Adapters |
| Option 23 | Two-10X Standard P6103 Probes |
| Option 24 | Two-1X to 10 X P6062B SelectableAttenuation Probes |
| Options A1-A5 | International Power Cords |

To obtain any of these options or other accessories after the instrument has been received, refer to Tables 7-1 (Power Cords and Fuses) and Tables 7-2 (Optional Accessories), in this section. For additional information about instrument options and other optional accessories, consult the current Tektronix Product Catalog or contact your local Tektronix Sales Office or distributor.

## OPTION 1C

When Option 1C is specified, a Tektronix $\mathrm{C}-5 \mathrm{C}$ Option 04 low-cost camera is included in the shipment. The camera is useful for capturing single events and documenting measurement results.

## OPTION 1K

When Option 1 K is specified, a K212 Portable Instrument Cart is included in the shipment. The cart provides a stable, movable platform that is well suited for on-site instrument mobility.

## OPTION 1R

When the oscilloscope is ordered with Option 1R, it is shipped in a configuration that permits easy installation into virtually any 19-inch wide electronic equipment rack. All hardware is supplied for mounting the instrument into the main frame.

Complete rack mounting instructions are provided in a separate document. These instructions also contain the procedures for converting a standard instrument into the Option 1R configuration by using the separately orderable rack-mounting conversion kit.

## OPTION 1T

When Option 1T is specified, a composite case of $24.5^{\prime \prime} \times 16.5^{\prime \prime} \times 11.5^{\prime \prime}$ that weighs 12 lbs .6 oz . is included in the shipment. The composite case is useful as a reusable shipping container or a carryon luggage container for the instrument.

## OPTION 02

Option 02 is intended for users who need added front-panel protection and accessories-carrying ease. It includes a protective front panel cover and an accessories pouch that attaches to the top of the instrument.

## OPTION 22

When Option 22 is specified, $241 \times$ Signal Adapters are included with the instrument. Each cable has one BNC Male connector on one end and two clip heads on the other end of the cable.

## OPTION 23

When Option 23 is specified, two P6103 10X Probes are included with the instrument.

## OPTION 24

When Option 24 is specified, two P6062B 1X to 10X Selectable-Attenuation Probes are included with the instrument.

OPTIONS A1-A5
INTERNATIONAL POWER CORDS
Instruments are shipped with the detachable power cord and fuse configuration ordered by the customer. Table 7-1 identifies the Tektronix part numbers for international power cords and associated fuses. Descriptive information about power cord options is provided in Section 1, Preparation for Use.

## OPTIONAL ACCESSORIES

Table 7-2 lists recommended optional accessories for your instrument.

Table 7-1
International Power Cords and Fuses

| Description | Part Number |
| :---: | :---: |
| Option A1 (Europe) |  |
| Power Cord, 2.5 m | 161-0104-06 |
| Fuse, $0.5 \mathrm{~A}, 250 \mathrm{~V}$, 3AG, $1 / 4 " \times 11 / 4$ ", Slow | 159-0032-00 |
| Option A2 (United Kingdom) |  |
| Power Cord, 2.5 m | 161-0104-07 |
| Fuse, $0.5 \mathrm{~A}, 250 \mathrm{~V}$, 3AG, $1 / 4 " \times 11 / 4$ ", Slow | 159-0032-00 |
| Option A3 (Australia) |  |
| Power Cord, 2.5 m | 161-0104-05 |
| Fuse, $0.5 \mathrm{~A}, 250 \mathrm{~V}$, 3AG, $1 / 4^{\prime \prime} \times 11 / 4$ ", Slow | 159-0032-00 |
| Option A4 (North America) |  |
| Power Cord, 2.5 m | 161-0104-08 |
| Fuse, $0.5 \mathrm{~A}, 250 \mathrm{~V}$, 3AG, $1 / 4^{\prime \prime} \times 11 / 4$ ", Slow | 159-0032-00 |
| Option A5 (Switzerland) |  |
| Power Cord, 2.5 m | 161-0167-00 |
| Fuse, $0.5 \mathrm{~A}, 250 \mathrm{~V}$, 3AG, $1 / 4^{\prime \prime} \times 11 / 4$ ", Slow | 159-0032-00 |

Table 7-2
Optional Accessories

| Description | Part Number |
| :--- | :--- |
| Front Panel Protective Cover | $200-3397-00$ |
| Accessory Pouch | $016-0677-02$ |
| Front Panel Protective Cover <br> and Accessory Pouch | $020-1514-00$ |
| Transit Case | $016-0792-01$ |

## STANDARD ACCESSORIES

Each instrument is shipped with the following standard accessories.

| Quantity | Description | Part Number |
| :---: | :---: | :---: |
| 2 | $1 \times$ Signal Adapters | 103-0275-00 |
| 1 | Operator's Manual | 070-6717-00 |
| 1 | Standard (United States) Power Cord, 2.5 m | 161-0230-01 |
| 1 | Fuse, $0.75 \mathrm{~A}, 25 \mathrm{~V}$, 3AG, $1 / 4^{\prime \prime} \times 1$ 1/4", slow | 159-0042-00 |
| 1 | Fuse, 0.5 A, 250 V , 3AG, $1 / 4^{\prime \prime} \times 11 / 4$ ", slow | 159-0032-00 |
|  | For optional power cord and fuse see Table 7-1 |  |
| 1 | Power Cord Clamp | 343-0003-00 |
| 1 | Screw, 6-32 | 211-0721-00 |
| 1 | Washer | 210-0803-00 |

# REPLACEABLE ELECTRICAL PARTS 

## PARTS ORDERING INFORMATION

Replacement parts are available from or through your local Tektronix, Inc. Field Office or representative.

Changes to Tektronix instruments are sometimes made to accommodate improved components as they become available, and to give you the benefit of the latest circuit improvements developed in our engineering department. It is therefore important, when ordering parts, to include the following information in your order: Part number, instrument type or number, serial number, and modification number it applicable.

If a part you have ordered has been replaced with a new or improved part, your local Tektronix, Inc. Field Office or representative will contact you concerning any change in part number

Change information, if any, is located at the rear of this manual.

## LIST OF ASSEMBLIES

A list of assemblies can be found at the beginning of the Electrical Parts List. The assemblies are listed in numerical order. When the complete component number of a part is known, this list will identify the assembly in which the part is located.

## CROSS INDEX-MFR. CODE NUMBER TO MANUFACTURER

The Mfr. Code Number to Manufacturer index for the Electrical Parts List is located immediately after this page. The Cross Index provides codes, names and addresses of manufacturers of components listed in the Electrical Parts List

## ABBREVIATIONS

Abbreviations conform to American National Standard Y1.1

## COMPONENT NUMBER (column one of the Electrical Parts List)

A numbering method has been used to identify assemblies, subassemblies and parts. Examples of this numbering method and typical expansions are illustrated by the following:

Read: Resistor 1234 of Assembly 23

Read: Resistor 1234 of Subassembly 2 of Assembly 23

Only the circuit number will appear on the diagrams and circuit board illustrations. Each diagram and circuit board illustration is clearly marked with the assembly number. Assembly numbers are also marked on the mechanical exploded views located in the Mechanical Parts List. The component number is obtained by adding the assembly number prefix to the circuit number.

The Electrical Parts List is divided and arranged by assemblies in numerical sequence (e.g., assembly $A 1$ with its subassemblies and parts, precedes assembly A2 with its subassemblies and parts).

Chassis-mounted parts have no assembly number prefix and are located at the end of the Electrical Parts List.

## TEKTRONIX PART NO. (column two of the Electrical Parts List)

Indicates part number to be used when ordering replacement part from Tektronix.

## SERIAL/MODEL NO. (columns three and four of the Electrical Parts List)

Column three (3) indicates the serial number at which the part was first used. Column four (4) indicates the serial number at which the part was removed. No serial number entered indicates part is good for all serial numbers.

## NAME \& DESCRIPTION (column five of the Electrical Parts List)

In the Parts List, an Item Name is separated from the description by a colon (:). Because of space limitations, an Item Name may sometimes appear as incomplete. For further ltem Name identification, the U.S. Federal Cataloging Handbook H6-1 can be utilized where possible.

## MFR. CODE (column six of the Electrical Parts List)

Indicates the code number of the actual manufacturer of the part. (Code to name and address cross reference can be found immediately after this page.)

## MFR. PART NUMBER (column seven of the Electrical Parts List)

Indicates actual manufacturers part number.

## DIAGRAMS AND CIRCUIT BOARD ILLUSTRATIONS

## Symbols

Graphic symbols and class designation letters are based on ANSI Standard Y32.2-1975.

Logic symbology is based on ANSI/IEEE 91-1984. Logic symbols depict the logic function performed and may differ from the manufacturer's data.

The overline on a signal name indicates that the signal performs its intended function when it is in the LO state.

Abbreviations are based on ANSI Y1.1-1972.

Other ANSI standards that are used in the preparation of diagrams by Tektronix, Inc., are:

Y14.15-1966 Drafting Practices.
Y14.2M-1979 Line Conventions and Lettering.
ANSI/IEEE 280-1985 Letter Symbols for Quantities Used in Electrical Science and Electrical Engineering.

American National Standards Institute 1430 Broadway
New York, New York 10018

## Component Values

Electrical components shown on the diagrams are in the following units unless noted otherwise:

Capacitors Values one or greater are in picofarads $(\mathrm{pF})$. Values less than one are in microfarads ( $\mu \mathrm{F}$ ).
Resistors Ohms ( $\Omega$ ).

## The information and special symbols below may appear in this manual.

## Assembly Numbers and Grid Coordinates

Each assembly in the instrument is assigned an assembly number (e.g., A20). The assembly number appears on the circuit board outline on the diagram, in the title for the circuit board component location illustration, and in the lookup table for the schematic diagram and corresponding component locator illustration. The Replaceable Electrical Parts list is arranged by assemblies in numerical sequence; the components are listed by component number *(see following illustration for constructing a component number).

The schematic diagram and circuit board component location illustration have grids. A lookup table with the grid coordinates is provided for ease of locating the component. Only the components illustrated on the facing diagram are listed in the lookup table. When more than one schematic diagram is used to illustrate the circuitry on a circuit board, the circuit board illustration may only appear opposite the first diagram on which it was illustrated; the lookup table will list the diagram number of other diagrams that the circuitry of the circuit board appears on.

(1) 2) and (3) 1 st, 2 nd, and 3 rd significant figures
(M) -multiplier
(T)-tolerance

| COLOR | SIGNIFICANT <br> FIGURES | RESISTORS |  |

Figure 9-1. Color codes for resistors.

Figure 9-2. Semiconductor lead configurations.

a. Identify the Assembly Number of the circuit board that the component is on by using the Circuit toard location illustration in this section or the
mechanical parts exploded views at the rear of this manual.
2. Determine the Circuit Number and Schematic Diagram
a. Compare the circuit board with its illustration. Locate the component you are looking for by area and shape on the illustration to determine its Circult Number
Scan the lookup table next to the Circuit Board illustration to find the Circuit Number of the component.
c. Read the SCHEM NUMBER column next to the component's circuit num

Locate the Component on the Schematic Diagram.
a. Locate the tabbed page that corresponds to the Schematic Diagram nun ber. Schematic diagram numbers and names are printed on the front sio of the tabs (facing the front of the manual).

Locate the Assembly Number in the Component Location lookup tab next to the schematic diagram. Scan the CIRCUIT NUMBER column that table to find the that table to find

NUMERAL AND LETTER AT SIGNAL LINES GRID COORDINATES ON ANOTHER SCHEMATIC
(FOR EXAMPLE: 8J)

1. Determine the Circcit Board Illustration and Component Location
a. From the schematic diagram, determine the Assembly Number of the circuit board that the component is on. The Assembly Number and Name is boxed and located in a corner of the heavy line marking the circuit board outine in the schematic diagram

Find the Component Location table for the Assembly Number found on the
schematic. Scan the CIRCUIT NUMBER column to find the Circuit Num ber of the component.
c. Look in the BOARD LOCATION column next to the component number and read its circuit board grid coordinates.
2. Locate the Component on the Circuit Board.
a. In the manual, locate the tabbed page that corresponds to Assembly Number the component is on. Assembly numbers and names for circuit boards are on the back side of the tabs.
b. Using the Circuit Number of the component and its given grid location, find the component in the Circuit Board illustration.
c. From the small circuit board location illustration shown next to the circuit board, find the circuit board's location in the instrument.
d. Find the circuit board in the instrument. Compare it with the circuit board Find the circuit board in the instrument. Compare it with the circuit board
illustration in the manual to locate the component on the circuit board itself.

## Digitally Remastered by ArtekMedia © 2002-2006

2. Determine the Circuit Number and Schematic Diagram.
a. Compare the circuit board with its illustration. Locate the component you
are looking for by area and shape on the illustration to determine its Circuit
Scan the lookup table next to the Circuit Board illustration to find the Circuit Number of the component.
c. Read the SCHEM NUMBER column next to the component's circuit num ber to find the Schematic Diagram number.
a. Locate the tabbed page that corresponds to the Schematic Diagram number. Schematic diagram numbers and names are printed on the front side of the tabs (facing the front of the manual).

Locate the Assembly Number in the Component Location lookup table next to the schematic diagram. Scan the CIRCUIT NUMBER column of that table to find the Circuit Number of the component you are looking for in the schematic.
c. In the SCHEM LOCATION column next to the component, read the grid coordinates of the component in the schematic.
d. Using the grid coordinates given, find the component in the schematic diagram.

2. Locate the Component on the Circuit Board
a. In the manual, locate the tabbed page that corresponds to Assembly Num. ber the component is on. Assembly numbers and names for circuit boards are on the back side of the tabs.
b. Using the Circuit Number of the component and its given grid location, find the component in the Circuit Board illustration.
c. From the small circuit board location illustration shown next to the circuit board, find the circuit board's location in the instrument.
d. Find the circuit board in the instrument. Compare it with the circuit board illustration in the manual to locate the component on the circuit board itself.

## VOLTAGE/WAVEFORM SETUP CONDITIONS

## WAVEFORMS

On the left-handed pages preceding the schematic diagrams are test waveform illustrations that are intended to aid in troubleshooting the instrument. To test the instrument for these waveforms, perform the Initial Measurements Setup procedure first. Changes to the Initial Measurement Setup are noted at the beginning of each set of waveforms.

## DC VOLTAGES

Typical voltage measurements located on the schematic diagrams were obtained with the instrument operating under the conditions specified in the Initial Measurements Setup procedure. Controlsetting changes required for specific voltages are indicated on each waveform page. Voltage measurements are referenced to the chassis ground.

## INITIAL MEASUREMENTS SETUP

To test the instrument for waveforms and voltages, set the initial control settings as follows:

Vertical (Both Channels)

| POSITION | Midrange |
| :--- | :--- |
| MODE | CH 1, NORM |
| VOLTS/DIV | 5 mV |
| VOLTS/DIV Variable | CAL detent |
| AC-GND-DC | GND |

Horizontal

| POSITION | Midrange |
| :--- | :--- |
| MAG | X1 |
| SEC/DIV | 0.2 ms |
| SEC/DIV Variable | CAL detent |

Trigger

| SLOPE | Positive $(-\Gamma)$ |
| :--- | :--- |
| MODE | P-P AUTO |
| SOURCE | VERT MODE |

## RECOMMENDED TEST EQUIPMENT

Test equipment in Table 4-1 in the Performance Check Procedure, Section 4, of this manual meets the required specifications for testing this instrument.

## POWER SUPPLY ISOLATION PROCEDURE

Each regulated supply has numerous feed points to external loads through the instrument. Diagram 8, power distribution, is used in conjunction with the schematic diagrams to determine the service jumper or component that may be lifted to isolate loads from the power supply.

If a supply comes up after lifting one of the isolating jumpers, it is very probable that short exists in the circuitry on that supply line. By lifting jumpers or 'other components in the supply line farther down the line, the circuit in which a short exists may be located.

Always set the POWER switch to OFF before soldering or unsoldering service jumpers or other components and before attempting to measure component resistance values.

## REPLACEABLE MECHANICAL PARTS

## PARTS ORDERING INFORMATION

Replacement parts are available from or through your tocal Tektronix, Inc. Field Office or representative.

Changes to Tektronix instruments are sometimes made to accommodate improved components as they become available, and to give you the benefit of the latest circuit improvements developed in our engineering department. It is therefore important, when ordering parts, to include the following information in your order: Part number, instrument type or number, serial number, and modification number if applicable.

If a part you have ordered has been replaced with a new or improved part, your local Tektronix, Inc. Field Office or representative will contact you concerning any change in part number.

Change information, if any, is located at the rear of this manual.

## ITEM NAME

In the Parts List, an item Name is separated from the description by a colon(:). Because of space limitations, an Item Name may sometimes appear as incomplete. For further Item Name identification, the U.S. Federal Cataloging Handbook H6-1 can be utilized where possible.

## FIGURE AND INDEX NUMBERS

Items in this section are referenced by figure and index numbers to the illustrations.

INDENTATION SYSTEM
This mechanical parts list is indented to indicate item relationships. Following is an example of the indentation system used in the description column.

12345
Name \& Description
Assembly and/or Component
Attaching parts for Assembly and/or Component
END ATTACHING PARTS
Detail Part of Assembly and/or Component Attaching parts for Detail Part

END ATTACHING PARTS
Parts of Detail Part
Attaching parts for Parts of Detail Part
END ATTACHING PARTS
Attaching Parts always appear in the same indentation as the item it mounts, while the detail parts are indented to the right. Indented items are part of, and included with, the next higher indentation.

Attaching parts must be purchased separately, unless otherwise specified.

## MANUAL CHANGE INFORMATION

At Tektronix, we continually strive to keep up with latest electronic developments by adding circuit and component improvements to our instruments as soon as they are developed and tested.

Sometimes, due to printing and shipping requirements, we can't get these changes immediately into printed manuals. Hence, your manual may contain new change information on following pages.

A single change may affect several sections. Since the change information sheets are carried in the manual until all changes are permanently entered, some duplication may occur. If no such change pages appear following this page, your manual is correct as printed.

## EFFECTIVE ALL SERIAL NUMBERS

## DIAGRAM CHANGES

DIAGRAM $2>$ VERTICAL PREAMP \& OUTPUT AMPLIFIER

Change the voltage for the "ON' condition at pin 3 of U225 (location 8 K ) to -5.0 V .

DIAGRAM 5$\rangle$ SWEEP GENERATOR \& HORIZONTAL AMPLIFIER

At the Collector of Q780 (location 3L) remove the voltage level of +14.4 V from the circuit. The correct voltage devel is +6.2 V .

DIAGRAM 7 POWER SUPPLY, Z-AXIS, \& CRT

At transistors Q941 and Q945 (location 7J) remove the connection shown between the Base and Emitter of each transistor.
